

Logic for Multiagent Systems

Master 1st Year, 1st Semester 2025/2026

Laurențiu Leuștean

Web page: <https://cs.unibuc.ro/~lleustean/Teaching/2025-LMS/index.html>

1

Agents

- ▶ The question **What is an agent?** does not have a definitive answer.
- ▶ Many competing, mutually inconsistent answers have been offered in the past.

Definition in [Michael Wooldridge, An Introduction to MultiAgent Systems, Second Edition](#), John Wiley & Sons, 2009:

An **agent** is a system that is capable of **independent (autonomous) action** on behalf of its user or owner (figuring out what needs to be done to satisfy design objectives, rather than constantly being told).

2

Multiagent systems

Definition in [Ronald Fagin, Joseph Halpern, Yoram Moses, Moshe Vardi, Reasoning about Knowledge](#), MIT Press, 1995:
A **multiagent system** is any collection of interacting agents.

Definition in [Michael Wooldridge, An Introduction to MultiAgent Systems, Second Edition](#), John Wiley & Sons, 2009:

A **multiagent system** is one that consists of a number of agents, which **interact** with one-another.

Agents act on behalf of users with different goals and motivations. To successfully interact, they require the ability to **cooperate**, **coordinate**, and **negotiate** with each other, much as people do.

Definition in [Yoav Shoham, Kevin Leyton-Brown, Multiagents Systems](#), Cambridge University Press, 2009:

A **multiagent system** is a system that includes multiple **autonomous** entities with either diverging information or diverging interests, or both.

3

Multiagent systems

The motivation for studying multiagent systems stems from interest in **artificial (software or hardware) agents**, for example software agents living on the Internet.

Examples

- ▶ autonomous robots in a multi-robot setting
- ▶ trading agents
- ▶ game-playing agents that assist (or replace) human players in a multiplayer game
- ▶ interface agents - that facilitate the interaction between the user and various computational resources
- ▶ ...

The subject is highly **interdisciplinary**. Many of the ideas apply to inquiries about human individuals and institutions.

4

Multiagent systemse

- ▶ Consider a multiagent system, in which multiple agents autonomously perform some joint action.
- ▶ The agents need to communicate with one another.
- ▶ Problems appear when the communication is error-prone.
- ▶ One could have scenarios like the following:
 - ▶ Agent *A* sent the message to agent *B*.
 - ▶ The message may not arrive, and agent *A* knows this.
 - ▶ Furthermore, this is common knowledge, so agent *A* knows that agent *B* knows that *A* knows that if a message was sent it may not arrive.

Example

Multiagent system = distributed system; agent = processor; action = computation

We use **epistemic logic** to make such reasoning precise.

5

Epistemic logics

The field of **epistemic logics** or **logics of knowledge** has begun with the publication, in 1962, of Jaakko Hintikka's book **Knowledge and Belief. An Introduction to the Logic of the Two Notions**.

Epistemic logics

- ▶ are **modal logics**, whose language contains **modal operators**, which are applied to formulas.
- ▶ use a **possible-worlds semantics**.
- ▶ an agent's knowledge is characterized in terms of a set of **possible worlds** (called **epistemic alternatives** by Hintikka), with an **accessibility** relation holding between them.
- ▶ something true in **all** our agent's epistemic alternatives could be said to be known by the agent.

6

Epistemic logics

Epistemic logics

- ▶ were developed in computer science for reasoning about multiagent systems.
- ▶ are used to prove properties of these systems.
- ▶ are used to represent and reason about the **information** that agents possess: their **knowledge**.

Ronald Fagin, Joseph Halpern, Yoram Moses, Moshe Vardi,
Reasoning about Knowledge, MIT Press, 1995

7

Propositional logic

8

Definition 1.1

The language of **propositional logic PL** consists of:

- ▶ a countable set $V = \{v_n \mid n \in \mathbb{N}\}$ of variables;
- ▶ the logic connectives \neg (**non**), \rightarrow (**implies**)
- ▶ parantheses: $(,)$.

- The set **Sym** of **symbols** of PL is

$$\text{Sym} := V \cup \{\neg, \rightarrow, (,)\}.$$

- We denote variables by $u, v, x, y, z \dots$

9

Definition 1.2

The set **Expr** of **expressions** of PL is the set of all finite sequences of symbols of PL.

Definition 1.3

Let $\theta = \theta_0\theta_1 \dots \theta_{k-1}$ be an expression, where $\theta_i \in \text{Sym}$ for all $i = 0, \dots, k-1$.

- ▶ If $0 \leq i \leq j \leq k-1$, then the expression $\theta_i \dots \theta_j$ is called the (i, j) -**subexpression** of θ .
- ▶ We say that an expression ψ **appears** in θ if there exists $0 \leq i \leq j \leq k-1$ such that ψ is the (i, j) -subexpression of θ .
- ▶ We denote by **Var**(θ) the set of variables appearing in θ .

10

The definition of formulas is an example of an **inductive definition**.

Definition 1.4

The **formulas** of PL are the expressions of PL defined as follows:

- (F0) Any variable is a formula.
- (F1) If φ is a formula, then $(\neg\varphi)$ is a formula.
- (F2) If φ and ψ are formulas, then $(\varphi \rightarrow \psi)$ is a formula.
- (F3) Only the expressions obtained by applying rules (F0), (F1), (F2) are formulas.

Notations

The set of formulas is denoted by **Form**. Formulas are denoted by $\varphi, \psi, \chi, \dots$

Proposition 1.5

The set **Form** is countable.

11

Unique readability

If φ is a formula, then **exactly** one of the following hold:

- ▶ $\varphi = v$, where $v \in V$.
- ▶ $\varphi = (\neg\psi)$, where ψ is a formula.
- ▶ $\varphi = (\psi \rightarrow \chi)$, where ψ, χ are formulas.

Furthermore, φ can be written in a unique way in one of these forms.

Definition 1.6

Let φ be a formula. A **subformula** of φ is any formula ψ that appears in φ .

12

Proposition 1.7 (Induction principle on formulas)

Let Γ be a set of formulas satisfying the following properties:

- ▶ $\mathcal{V} \subseteq \Gamma$.
- ▶ Γ is closed to \neg , that is: $\varphi \in \Gamma$ implies $(\neg\varphi) \in \Gamma$.
- ▶ Γ is closed to \rightarrow , that is: $\varphi, \psi \in \Gamma$ implies $(\varphi \rightarrow \psi) \in \Gamma$.

Then $\Gamma = \text{Form}$.

It is used to prove that all formulas have a property \mathcal{P} : we define Γ as the set of all formulas satisfying \mathcal{P} and apply induction on formulas to obtain that $\Gamma = \text{Form}$.

13

The derived connectives \vee (or), \wedge (and), \leftrightarrow (if and only if) are introduced by the following abbreviations:

$$\varphi \vee \psi := ((\neg\varphi) \rightarrow \psi)$$

$$\varphi \wedge \psi := \neg(\varphi \rightarrow (\neg\psi))$$

$$\varphi \leftrightarrow \psi := ((\varphi \rightarrow \psi) \wedge (\psi \rightarrow \varphi))$$

Conventions and notations

- ▶ The external parantheses are omitted, we put them only when necessary. We write $\neg\varphi$, $\varphi \rightarrow \psi$, but we write $(\varphi \rightarrow \psi) \rightarrow \chi$.
- ▶ To reduce the use of parantheses, we assume that
 - ▶ \neg has higher precedence than $\rightarrow, \wedge, \vee, \leftrightarrow$;
 - ▶ \wedge, \vee have higher precedence than $\rightarrow, \leftrightarrow$.
- ▶ Hence, the formula $((\varphi \rightarrow (\psi \vee \chi)) \wedge ((\neg\psi) \leftrightarrow (\psi \vee \chi)))$ is written as $(\varphi \rightarrow \psi \vee \chi) \wedge (\neg\psi \leftrightarrow \psi \vee \chi)$.

14

Truth values

We use the following notations for the truth values:

1 for true and 0 for false.

Hence, the set of truth values is $\{0, 1\}$.

Define the following operations on $\{0, 1\}$ using truth tables.

$$\neg : \{0, 1\} \rightarrow \{0, 1\},$$

p	$\neg p$
0	1
1	0

$$\rightarrow : \{0, 1\} \times \{0, 1\} \rightarrow \{0, 1\},$$

p	q	$p \rightarrow q$
0	0	1
0	1	1
1	0	0
1	1	1

15

$$\vee : \{0, 1\} \times \{0, 1\} \rightarrow \{0, 1\},$$

p	q	$p \vee q$
0	0	0
0	1	1
1	0	1
1	1	1

$$\wedge : \{0, 1\} \times \{0, 1\} \rightarrow \{0, 1\},$$

p	q	$p \wedge q$
0	0	0
0	1	0
1	0	0
1	1	1

$$\leftrightarrow : \{0, 1\} \times \{0, 1\} \rightarrow \{0, 1\},$$

p	q	$p \leftrightarrow q$
0	0	1
0	1	0
1	0	0
1	1	1

16

Definition 1.8

An **evaluation** (or **interpretation**) is a function $e : V \rightarrow \{0, 1\}$.

Theorem 1.9

For any evaluation $e : V \rightarrow \{0, 1\}$ there exists a unique function $e^+ : \text{Form} \rightarrow \{0, 1\}$

satisfying the following properties:

- ▶ $e^+(v) = e(v)$ for all $v \in V$.
- ▶ $e^+(\neg\varphi) = \neg e^+(\varphi)$ for any formula φ .
- ▶ $e^+(\varphi \rightarrow \psi) = e^+(\varphi) \rightarrow e^+(\psi)$ for any formulas φ, ψ .

Proposition 1.10

For any formula φ and all evaluations $e_1, e_2 : V \rightarrow \{0, 1\}$,
if $e_1(v) = e_2(v)$ for all $v \in \text{Var}(\varphi)$, then $e_1^+(\varphi) = e_2^+(\varphi)$.

17

Let φ be a formula.

Definition 1.11

- ▶ An evaluation $e : V \rightarrow \{0, 1\}$ is a **model** of φ if $e^+(\varphi) = 1$.
Notation: $e \models \varphi$.
- ▶ φ is **satisfiable** if it has a model.
- ▶ If φ is not satisfiable, we also say that φ is **unsatisfiable** or **contradictory**.
- ▶ φ is a **tautology** if every evaluation is a model of φ .
Notation: $\models \varphi$.

Notation 1.12

The set of models of φ is denoted by $\text{Mod}(\varphi)$.

18

Remark 1.13

- ▶ φ is a **tautology** iff $\neg\varphi$ is **unsatisfiable**.
- ▶ φ is **unsatisfiable** iff $\neg\varphi$ is a **tautology**.

Proposition 1.14

Let $e : V \rightarrow \{0, 1\}$ be an evaluation. Then for all formulas φ, ψ ,

- ▶ $e \models \neg\varphi$ iff $e \not\models \varphi$.
- ▶ $e \models \varphi \rightarrow \psi$ iff ($e \models \varphi$ implies $e \models \psi$) iff ($e \not\models \varphi$ or $e \models \psi$).
- ▶ $e \models \varphi \vee \psi$ iff ($e \models \varphi$ or $e \models \psi$).
- ▶ $e \models \varphi \wedge \psi$ iff ($e \models \varphi$ and $e \models \psi$).
- ▶ $e \models \varphi \leftrightarrow \psi$ iff ($e \models \varphi$ iff $e \models \psi$).

19

Definition 1.15

Let φ, ψ be formulas. We say that

- ▶ φ is a **semantic consequence** of ψ if $\text{Mod}(\psi) \subseteq \text{Mod}(\varphi)$.
Notation: $\psi \models \varphi$.
- ▶ φ and ψ are **(logically) equivalent** if $\text{Mod}(\psi) = \text{Mod}(\varphi)$.
Notation: $\varphi \sim \psi$.

Remark 1.16

Let φ, ψ be formulas.

- ▶ $\psi \models \varphi$ iff $\models \psi \rightarrow \varphi$.
- ▶ $\psi \sim \varphi$ iff ($\psi \models \varphi$ and $\varphi \models \psi$) iff $\models \psi \leftrightarrow \varphi$.

20

For all formulas φ, ψ, χ ,

- $\models \varphi \vee \neg\varphi$
- $\models \neg(\varphi \wedge \neg\varphi)$
- $\models \varphi \wedge \psi \rightarrow \varphi$
- $\models \varphi \rightarrow \varphi \vee \psi$
- $\models \varphi \rightarrow (\psi \rightarrow \varphi)$
- $\models (\varphi \rightarrow (\psi \rightarrow \chi)) \rightarrow ((\varphi \rightarrow \psi) \rightarrow (\varphi \rightarrow \chi))$
- $\models (\varphi \rightarrow \psi) \rightarrow ((\psi \rightarrow \chi) \rightarrow (\varphi \rightarrow \chi))$
- $\models (\varphi \rightarrow \psi) \vee (\neg\varphi \rightarrow \psi)$
- $\models (\varphi \rightarrow \psi) \vee (\varphi \rightarrow \neg\psi)$
- $\models \neg\varphi \rightarrow (\neg\psi \leftrightarrow (\psi \rightarrow \varphi))$
- $\models (\varphi \rightarrow \psi) \rightarrow (((\varphi \rightarrow \chi) \rightarrow \psi) \rightarrow \psi)$
- $\models \neg\psi \rightarrow (\psi \rightarrow \varphi)$

- $\models \psi \rightarrow (\neg\psi \rightarrow \varphi)$
- $\models (\varphi \rightarrow \neg\varphi) \rightarrow \neg\varphi$
- $\models (\neg\varphi \rightarrow \varphi) \rightarrow \varphi$
- $\psi \models \varphi \rightarrow \psi$
- $\neg\varphi \models \varphi \rightarrow \psi$
- $\neg\psi \wedge (\varphi \rightarrow \psi) \models \neg\varphi$
- $(\varphi \rightarrow \psi) \wedge (\psi \rightarrow \chi) \models \varphi \rightarrow \chi$
- $\varphi \wedge (\varphi \rightarrow \psi) \models \psi$

- $\varphi \vee \psi \sim \neg(\neg\varphi \wedge \neg\psi)$
- $\varphi \wedge \psi \sim \neg(\neg\varphi \vee \neg\psi)$
- $\varphi \rightarrow (\psi \rightarrow \chi) \sim \varphi \wedge \psi \rightarrow \chi$
- $\varphi \sim \varphi \wedge \varphi \sim \varphi \vee \varphi$
- $\varphi \wedge \psi \sim \psi \wedge \varphi$
- $\varphi \vee \psi \sim \psi \vee \varphi$
- $\varphi \wedge (\psi \wedge \chi) \sim (\varphi \wedge \psi) \wedge \chi$
- $\varphi \vee (\psi \vee \chi) \sim (\varphi \vee \psi) \vee \chi$
- $\varphi \vee (\varphi \wedge \psi) \sim \varphi$
- $\varphi \wedge (\varphi \vee \psi) \sim \varphi$

- $\varphi \wedge (\psi \vee \chi) \sim (\varphi \wedge \psi) \vee (\varphi \wedge \chi)$
- $\varphi \vee (\psi \wedge \chi) \sim (\varphi \vee \psi) \wedge (\varphi \vee \chi)$
- $\varphi \rightarrow \psi \wedge \chi \sim (\varphi \rightarrow \psi) \wedge (\varphi \rightarrow \chi)$
- $\varphi \rightarrow \psi \vee \chi \sim (\varphi \rightarrow \psi) \vee (\varphi \rightarrow \chi)$
- $\varphi \wedge \psi \rightarrow \chi \sim (\varphi \rightarrow \chi) \vee (\psi \rightarrow \chi)$
- $\varphi \vee \psi \rightarrow \chi \sim (\varphi \rightarrow \chi) \wedge (\psi \rightarrow \chi)$
- $\varphi \rightarrow (\psi \rightarrow \chi) \sim \psi \rightarrow (\varphi \rightarrow \chi)$
- $\sim (\varphi \rightarrow \psi) \rightarrow (\varphi \rightarrow \chi)$
- $\neg\varphi \sim \varphi \rightarrow \neg\varphi \sim (\varphi \rightarrow \psi) \wedge (\varphi \rightarrow \neg\psi)$
- $\varphi \rightarrow \psi \sim \neg\varphi \vee \psi \sim \neg(\varphi \wedge \neg\psi)$
- $\varphi \vee \psi \sim \varphi \vee (\neg\varphi \wedge \psi) \sim (\varphi \rightarrow \psi) \rightarrow \psi$
- $\varphi \leftrightarrow (\psi \leftrightarrow \chi) \sim (\varphi \leftrightarrow \psi) \leftrightarrow \chi$

It is often useful to have a canonical tautology and a canonical unsatisfiable formula.

Remark 1.17

$v_0 \rightarrow v_0$ is a tautology and $\neg(v_0 \rightarrow v_0)$ is unsatisfiable.

Notation 1.18

Denote $v_0 \rightarrow v_0$ by \top and call it *the truth*.

Denote $\neg(v_0 \rightarrow v_0)$ by \perp and call it *the false*.

Remark 1.19

- ▶ φ is a tautology iff $\varphi \sim \top$.
- ▶ φ is unsatisfiable iff $\varphi \sim \perp$.

25

Let Γ be a set of formulas.

Definition 1.20

An evaluation $e : V \rightarrow \{0, 1\}$ is a *model* of Γ if it is a model of every formula from Γ .

Notation: $e \models \Gamma$.

Notation 1.21

The set of models of Γ is denoted by $\text{Mod}(\Gamma)$.

Definition 1.22

A formula φ is a *semantic consequence* of Γ if $\text{Mod}(\Gamma) \subseteq \text{Mod}(\varphi)$.

Notation: $\Gamma \models \varphi$.

26

Definition 1.23

- ▶ Γ is *satisfiable* if it has a model.
- ▶ Γ is *finitely satisfiable* if every finite subset of Γ is satisfiable.
- ▶ If Γ is not satisfiable, we say also that Γ is *unsatisfiable* or *contradictory*.

Proposition 1.24

The following are equivalent:

- ▶ Γ is unsatisfiable.
- ▶ $\Gamma \models \perp$.

Theorem 1.25 (Compactness Theorem)

Γ is satisfiable iff Γ is finitely satisfiable.

27

We use a *deductive system* of Hilbert type for LP .

Logical axioms

The set Axiom of *(logical) axioms* of LP consists of:

- (A1) $\varphi \rightarrow (\psi \rightarrow \varphi)$
- (A2) $(\varphi \rightarrow (\psi \rightarrow \chi)) \rightarrow ((\varphi \rightarrow \psi) \rightarrow (\varphi \rightarrow \chi))$
- (A3) $(\neg\psi \rightarrow \neg\varphi) \rightarrow (\varphi \rightarrow \psi)$,

where φ , ψ and χ are formulas.

The deduction rule

For any formulas φ , ψ , from φ and $\varphi \rightarrow \psi$ infer ψ (*modus ponens* or *(MP)*):

$$\frac{\varphi, \varphi \rightarrow \psi}{\psi}$$

28

Let Γ be a set of formulas. The definition of Γ -theorems is another example of an inductive definition.

Definition 1.26

The Γ -theorems of PL are the formulas defined as follows:

- (T0) Every logical axiom is a Γ -theorem.
- (T1) Every formula of Γ is a Γ -theorem.
- (T2) If φ and $\varphi \rightarrow \psi$ are Γ -theorems, then ψ is a Γ -theorem.
- (T3) Only the formulas obtained by applying rules (T0), (T1), (T2) are Γ -theorems.

If φ is a Γ -theorem, then we also say that φ is **deduced from the hypotheses** Γ .

29

Notations

- $\Gamma \vdash \varphi$ $:\Leftrightarrow$ φ is a Γ -theorem
- $\vdash \varphi$ $:\Leftrightarrow$ $\emptyset \vdash \varphi$.

Definition 1.27

A formula φ is called a **theorem** of LP if $\vdash \varphi$.

By a reformulation of the conditions (T0), (T1), (T2) using the notation \vdash , we get

Remark 1.28

- ▶ If φ is an axiom, then $\Gamma \vdash \varphi$.
- ▶ If $\varphi \in \Gamma$, then $\Gamma \vdash \varphi$.
- ▶ If $\Gamma \vdash \varphi$ and $\Gamma \vdash \varphi \rightarrow \psi$, then $\Gamma \vdash \psi$.

30

Definition 1.29

A Γ -proof (or **proof from the hypotheses** Γ) is a sequence of formulas $\theta_1, \dots, \theta_n$ such that for all $i \in \{1, \dots, n\}$, one of the following holds:

- ▶ θ_i is an axiom.
- ▶ $\theta_i \in \Gamma$.
- ▶ there exist $k, j < i$ such that $\theta_k = \theta_j \rightarrow \theta_i$.

Definition 1.30

Let φ be a formula. A Γ -proof of φ or a **proof of φ from the hypotheses** Γ is a Γ -proof $\theta_1, \dots, \theta_n$ such that $\theta_n = \varphi$.

Proposition 1.31

For any formula φ ,

$$\Gamma \vdash \varphi \quad \text{iff} \quad \text{there exists a } \Gamma\text{-proof of } \varphi.$$

31

Theorem 1.32 (Deduction Theorem)

Let $\Gamma \cup \{\varphi, \psi\}$ be a set of formulas. Then

$$\Gamma \cup \{\varphi\} \vdash \psi \quad \text{iff} \quad \Gamma \vdash \varphi \rightarrow \psi.$$

Proposition 1.33

For any formulas φ, ψ, χ ,

$$\begin{aligned} &\vdash (\varphi \rightarrow \psi) \rightarrow ((\psi \rightarrow \chi) \rightarrow (\varphi \rightarrow \chi)) \\ &\vdash (\varphi \rightarrow (\psi \rightarrow \chi)) \rightarrow (\psi \rightarrow (\varphi \rightarrow \chi)) \end{aligned}$$

Proposition 1.34

Let $\Gamma \cup \{\varphi, \psi, \chi\}$ be a set of formulas.

$$\begin{aligned} &\Gamma \vdash \varphi \rightarrow \psi \text{ and } \Gamma \vdash \psi \rightarrow \chi \Rightarrow \Gamma \vdash \varphi \rightarrow \chi \\ &\Gamma \cup \{\neg\psi\} \vdash \neg(\varphi \rightarrow \varphi) \Rightarrow \Gamma \vdash \psi \\ &\Gamma \cup \{\psi\} \vdash \varphi \text{ and } \Gamma \cup \{\neg\psi\} \vdash \varphi \Rightarrow \Gamma \vdash \varphi. \end{aligned}$$

32

Consistent sets

Let Γ be a set of formulas.

Definition 1.35

Γ is called **consistent** if there exists a formula φ such that $\Gamma \not\vdash \varphi$.

Γ is said to be **inconsistent** if it is not consistent, that is $\Gamma \vdash \varphi$ for any formula φ .

Proposition 1.36

- ▶ \emptyset is consistent.
- ▶ The set of theorems is consistent.

Proposition 1.37

The following are equivalent:

- ▶ Γ is inconsistent.
- ▶ $\Gamma \vdash \perp$.

33

Completeness Theorem

Theorem 1.38 (Completeness Theorem (version 1))

Let Γ be a set of formulas. Then

$$\Gamma \text{ is consistent} \iff \Gamma \text{ is satisfiable.}$$

Theorem 1.39 (Completeness Theorem (version 2))

Let Γ be a set of formulas. For any formula φ ,

$$\Gamma \vdash \varphi \iff \Gamma \models \varphi.$$

34

Modal Logics

Textbook:

P. Blackburn, M. de Rijke, Y. Venema, Modal logic, Cambridge Tracts in Theoretical Computer Science 53, Cambridge University Press, 2001

35

Basic modal language

Definition 2.1

The **basic modal language** ML_0 consists of:

- ▶ a set *PROP* of **atomic propositions** (denoted p, q, r, \dots);
- ▶ the propositional connectives: \neg, \rightarrow ;
- ▶ parentheses: $(,)$;
- ▶ the modal operator \Box (**box**).

The set $Sym(ML_0)$ of **symbols** of ML_0 is

$$Sym(ML_0) := PROP \cup \{\neg, \rightarrow, (,), \Box\}.$$

The **expressions** of ML_0 are the finite sequences of symbols of ML_0 .

36

Definition 2.2

The **formulas** of the basic modal language ML_0 are the expressions inductively defined as follows:

- (F0) Every atomic proposition is a formula.
- (F1) If φ is a formula, then $(\neg\varphi)$ is a formula.
- (F2) If φ and ψ are formulas, then $(\varphi \rightarrow \psi)$ is a formula.
- (F3) If φ is a formula, then $(\Box\varphi)$ is a formula.
- (F4) Only the expressions obtained by applying rules (F0), (F1), (F2), (F3) are formulas.

Notation: The set of formulas is denoted by $Form(ML_0)$.

37

Formulas of ML_0 are defined, using the Backus-Naur notation, as follows:

$$\varphi ::= p \mid (\neg\varphi) \mid (\varphi \rightarrow \psi) \mid (\Box\varphi), \quad \text{where } p \in PROP.$$

Proposition 2.3 (Induction principle on formulas)

Let Γ be a set of formulas satisfying the following properties:

- ▶ $PROP \subseteq \Gamma$.
- ▶ Γ is closed to \neg , that is: $\varphi \in \Gamma$ implies $(\neg\varphi) \in \Gamma$.
- ▶ Γ is closed to \rightarrow , that is: $\varphi, \psi \in \Gamma$ implies $(\varphi \rightarrow \psi) \in \Gamma$.
- ▶ Γ is closed to \Box , that is: $\varphi \in \Gamma$ implies $(\Box\varphi) \in \Gamma$.

Then $\Gamma = Form$.

It is used to prove that all formulas have a property \mathcal{P} : we define Γ as the set of all formulas satisfying \mathcal{P} and apply induction on formulas to obtain that $\Gamma = Form$.

38

Derived connectives

Connectives \vee , \wedge , \leftrightarrow and the constants \top (**true**), \perp (**false**) are introduced as in classical propositional logic:

$$\begin{aligned} \varphi \vee \psi &:= ((\neg\varphi) \rightarrow \psi) & \varphi \wedge \psi &:= \neg(\varphi \rightarrow (\neg\psi)) \\ \varphi \leftrightarrow \psi &:= ((\varphi \rightarrow \psi) \wedge (\psi \rightarrow \varphi)) \\ \top &:= p \rightarrow p, \text{ where } p \in PROP, & \perp &:= \neg\top \end{aligned}$$

Dual modal operator

The dual of \Box is denoted by \Diamond (**diamond**) and is defined as:

$$\Diamond\varphi := (\neg(\Box(\neg\varphi)))$$

for every formula φ .

39

Usually the external parentheses are omitted, we write them only when necessary. We write $\neg\varphi$, $\varphi \rightarrow \psi$, $\Box\varphi$.

To reduce the use of parentheses, we assume that

- ▶ modal operators \Diamond and \Box have higher precedence than the other connectives.
- ▶ \neg has higher precedence than \rightarrow , \wedge , \vee , \leftrightarrow ;
- ▶ \wedge , \vee have higher precedence than \rightarrow , \leftrightarrow .

40

Classical modal logic

In classical modal logic,

- ▶ $\Box\varphi$ is read as **is necessarily φ** .
- ▶ $\Diamond\varphi$ means **it is not necessary that not φ** , that is **it is possible the case that φ** .

Examples of formulas we would probably regard as correct principles

- ▶ $\Box\varphi \rightarrow \Diamond\varphi$ (**whatever is necessary is possible**)
- ▶ $\varphi \rightarrow \Diamond\varphi$ (**whatever is, is possible**).

The status of other formulas is harder to decide. What can we say about $\varphi \rightarrow \Box\Diamond\varphi$ (**whatever is, is necessarily possible**) or $\Diamond\varphi \rightarrow \Box\Diamond\varphi$ (**whatever is possible, is necessarily possible**)? Can we consider them as general truths? In order to give an answer to such questions, one has to define a **semantics** for the classical modal logic.

41

Definition 2.4

A **relational structure** is a tuple \mathcal{F} consisting of:

- ▶ a nonempty set W , called the **universe** (or **domain**) of \mathcal{F} , and
- ▶ a set of relations on W .

We assume that every relational structure contains at least one relation. The elements of W are called **points**, **nodes**, **states**, **worlds**, **times**, **instances** or **situations**.

Example 2.5

A partially ordered set $\mathcal{F} = (W, R)$, where R is a partial order relation on W .

42

Labeled Transition Systems (LTSs), or more simply, transition systems, are very simple relational structures widely used in computer science.

Definition 2.6

An **LTS** is a pair $(W, \{R_a \mid a \in A\})$, where W is a nonempty set of **states**, A is a nonempty set of **labels** and, for every $a \in A$,

$$R_a \subseteq W \times W$$

is a binary relation on W .

LTSs can be viewed as an abstract model of computation: the states are the possible states of a computer, the labels stand for programs, and $(u, v) \in R_a$ means that there is an execution of the program a starting in state u and terminating in state v .

43

Let W be a nonempty set and $R \subseteq W \times W$ be a binary relation.

We write usually Rwv or wRv instead of $(w, v) \in R$. If Rwv , then we say that v is **R -accessible** from w .

The **inverse** of R , denoted by R^{-1} , is defined as follows:

$$R^{-1}vw \text{ iff } Rwv.$$

We define R^n ($n \geq 0$) inductively:

$$R^0 = \{(w, w) \mid w \in W\}, \quad R^1 = R, \quad R^{n+1} = R \circ R^n.$$

Thus, for any $n \geq 2$, we have that $R^n wv$ iff there exists u_1, \dots, u_{n-1} such that $Rwu_1, Ru_1u_2, \dots, Ru_{n-1}v$.

44

In the sequel we give the **semantics** of the basic modal language ML_0 .

We will do this in two distinct ways:

- ▶ at the level of **models**, where the fundamental notion of **satisfaction** (or **truth**) is defined.
- ▶ at the level of frames, where the key notion of **validity** is defined.

Definition 2.7

A **frame** for ML_0 is a pair $\mathcal{F} = (W, R)$ such that

- ▶ W is a nonempty set;
- ▶ R is a binary relation on W .

That is, a frame for the basic modal language is simply a relational structure with a single binary relation.

Interpretation using agents

R_{wv} holds iff the agent considers the world v possible according to the informations available in the world w . We think of R as a **possibility** relation, as R defines worlds that are considered possible by the agent.

Definition 2.8

A **model** for ML_0 is a pair $\mathcal{M} = (\mathcal{F}, V)$, where

- ▶ $\mathcal{F} = (W, R)$ is a frame for ML_0 ;
- ▶ $V : PROP \rightarrow 2^W$ is a function called **valuation**.

Thus, V assigns to each atomic proposition $p \in PROP$ a subset $V(p)$ of W . Informally, we think of $V(p)$ as the set of points in the model \mathcal{M} where p is true.

Note that models for ML_0 can also be viewed as relational structures in a natural way:

$$\mathcal{M} = (W, R, \{V(p) \mid p \in PROP\}).$$

Thus, a model is a relational structure consisting of a domain, a single binary relation R and the unary relations $V(p), p \in PROP$. A frame \mathcal{F} and a model \mathcal{M} are two relational structures based on the same universe. However, as we shall see, frames and models are used **very** differently.

Let $\mathcal{F} = (W, R)$ be a frame and $\mathcal{M} = (\mathcal{F}, V)$ be a model. We also write $\mathcal{M} = (W, R, V)$.

We say that the model $\mathcal{M} = (\mathcal{F}, V)$ is **based on** the frame $\mathcal{F} = (W, R)$ or that \mathcal{F} is the frame **underlying** \mathcal{M} . Elements of W are called **states** in \mathcal{F} or in \mathcal{M} . We often write $w \in \mathcal{F}$ or $w \in \mathcal{M}$.

Remark

Elements of W are also called **worlds** or **possible worlds**, having as inspiration Leibniz's philosophy and the reading of basic modal language in which

$\Box\varphi$ means **necessarily** φ and $\Diamond\varphi$ means **possibly** φ .

In Leibniz's view, **necessity** means **truth in all possible worlds** and **possibility** means **truth in some possible world**.

We define now the notion of satisfaction.

Definition 2.9

Let $\mathcal{M} = (W, R, V)$ be a model and w a state in \mathcal{M} . We define inductively the notion

formula φ *is satisfied (or true) in \mathcal{M} at state w ,*

Notation $\mathcal{M}, w \Vdash \varphi$

$\mathcal{M}, w \Vdash p$ iff $w \in V(p)$, where $p \in PROP$

$\mathcal{M}, w \Vdash \neg\varphi$ iff it is not true that $\mathcal{M}, w \Vdash \varphi$

$\mathcal{M}, w \Vdash \varphi \rightarrow \psi$ iff $\mathcal{M}, w \Vdash \varphi$ implies $\mathcal{M}, w \Vdash \psi$

$\mathcal{M}, w \Vdash \Box\varphi$ iff for every $v \in W$, Rwv implies $\mathcal{M}, v \Vdash \varphi$.

49

Let $\mathcal{M} = (W, R, V)$ be a model.

Notation

If \mathcal{M} does not satisfy φ at w , we write $\mathcal{M}, w \nVdash \varphi$ and we say that φ is *false* in \mathcal{M} at state w .

It follows from Definition 2.9 that for every state $w \in W$,

► $\mathcal{M}, w \Vdash \neg\varphi$ iff $\mathcal{M}, w \nVdash \varphi$.

Notation

We can extend the valuation V from atomic propositions to arbitrary formulas φ so that $V(\varphi)$ is the set of all states in \mathcal{M} at which φ is true:

$$V(\varphi) = \{w \mid \mathcal{M}, w \Vdash \varphi\}.$$

50

Let $\mathcal{M} = (W, R, V)$ be a model and w a state in \mathcal{M} .

Proposition 2.10

For every formulas φ, ψ ,

$\mathcal{M}, w \Vdash \varphi \vee \psi$ iff $\mathcal{M}, w \Vdash \varphi$ or $\mathcal{M}, w \Vdash \psi$

$\mathcal{M}, w \Vdash \varphi \wedge \psi$ iff $\mathcal{M}, w \Vdash \varphi$ and $\mathcal{M}, w \Vdash \psi$

Proposition 2.11

For every formula φ ,

$\mathcal{M}, w \Vdash \Diamond\varphi$ iff there exists $v \in W$ such that Rwv and $\mathcal{M}, v \Vdash \varphi$.

51

Let $\mathcal{M} = (W, R, V)$ be a model and w a state in \mathcal{M} .

Proposition 2.12

For every $n \geq 1$ and every formula φ , define

$$\Diamond^n \varphi := \underbrace{\Diamond \Diamond \dots \Diamond}_{n \text{ times}} \varphi, \quad \Box^n \varphi := \underbrace{\Box \Box \dots \Box}_{n \text{ times}} \varphi.$$

Then

$\mathcal{M}, w \Vdash \Diamond^n \varphi$ iff there exists $v \in W$ s.t. $R^n wv$ and $\mathcal{M}, v \Vdash \varphi$

$\mathcal{M}, w \Vdash \Box^n \varphi$ iff for every $v \in W$, $R^n wv$ implies $\mathcal{M}, v \Vdash \varphi$.

52

Let $\mathcal{M} = (W, R, V)$ be a model.

Definition 2.13

- ▶ A formula φ is **globally true** or simply **true** in \mathcal{M} if $\mathcal{M}, w \Vdash \varphi$ for every $w \in W$. **Notation:** $\mathcal{M} \Vdash \varphi$
- ▶ A formula φ is **satisfiable** in \mathcal{M} if there exists a state $w \in W$ such that $\mathcal{M}, w \Vdash \varphi$.

Definition 2.14

Let Σ be a set of formulas.

- ▶ Σ is **true** at state w in \mathcal{M} if $\mathcal{M}, w \Vdash \varphi$ for every $\varphi \in \Sigma$.
Notation: $\mathcal{M}, w \Vdash \Sigma$
- ▶ Σ is **globally true** or simply **true** in \mathcal{M} if $\mathcal{M}, w \Vdash \Sigma$ for every state w in \mathcal{M} . **Notation:** $\mathcal{M} \Vdash \Sigma$
- ▶ Σ is **satisfiable** in \mathcal{M} if there exists a state $w \in W$ such that $\mathcal{M}, w \Vdash \Sigma$.

53

A model $\mathcal{M} = (W, R, V)$ is represented as a labeled directed graph:

- ▶ the nodes of the graph are the states of the model;
- ▶ the label of each node $w \in W$ describes which atomic propositions are true at state w ;
- ▶ there exists an edge from node w to node v iff Rwv holds.

Example

We know that $PROP = \{p, q, r\}$. Then $\mathcal{M} = (W, R, V)$, where $W = \{w_1, w_2, w_3, w_4, w_5\}$; $Rw_i w_j$ iff $j = i + 1$; $V(p) = \{w_2, w_3\}$, $V(q) = \{w_1, w_2, w_3, w_4, w_5\}$ and $V(r) = \emptyset$.

54

Example

Let $\mathcal{M} = (W, R, V)$ be the model represented by:

- $\mathcal{M}, w_1 \Vdash \Diamond \Box p$.
- $\mathcal{M}, w_1 \not\Vdash \Diamond \Box p \rightarrow p$.
- $\mathcal{M}, w_2 \Vdash \Diamond(p \wedge \neg r)$.
- $\mathcal{M}, w_1 \Vdash q \wedge \Diamond(q \wedge \Diamond(q \wedge \Diamond(q \wedge \Diamond q)))$.
- $\mathcal{M} \Vdash \Box q$.

Proof: (i) $\mathcal{M}, w_1 \Vdash \Diamond \Box p$ iff there exists $v \in W$ such that $Rw_1 v$ and $\mathcal{M}, v \Vdash \Box p$. Take $v := w_2$. As $Rw_1 w_2$, it remains to prove that $\mathcal{M}, w_2 \Vdash \Box p$. We have that $\mathcal{M}, w_2 \Vdash \Box p \iff$ for all $u \in W$, $Rw_2 u$ implies $\mathcal{M}, u \Vdash p \iff \mathcal{M}, w_3 \Vdash p$ (as w_3 is the unique $u \in W$ s.t. $Rw_2 u$) $\iff w_3 \in V(p)$, which is true.

55

Example

Let $\mathcal{M} = (W, R, V)$ be the model represented by:

Proof: (ii) We have that $\mathcal{M}, w_1 \not\Vdash \Diamond \Box p \rightarrow p \iff \mathcal{M}, w_1 \Vdash \Diamond \Box p$ and $\mathcal{M}, w_1 \not\Vdash p$. Apply (i) and the fact that $w_1 \notin V(p)$.
(iii), (iv) Exercise.
(v) Let $w \in W$ be arbitrary. Then $\mathcal{M}, w \Vdash \Box q \iff$ for all $v \in W$, Rwv implies $\mathcal{M}, v \Vdash q \iff$ for all $v \in W$, Rwv implies $v \in V(q)$, which is true, as $V(q) = W$.

56

The notion of satisfaction is **internal** and **local**. We evaluate formulas **inside** models, at some particular state w (the **current state**). Modal operators \Diamond, \Box work locally: we verify the truth of φ **only** in the states that are R -accessible from the current one.

At first sight this may seem a weakness of the satisfaction definition. In fact, it is its greatest source of strength, as it gives us great flexibility.

For example, if we take $R = W \times W$, then all states are accessible from the current state; this corresponds to the Leibnizian idea in its purest form.

Going to the other extreme, if we take $R = \{(v, v) \mid v \in W\}$, then no state has access to any other.

Between these extremes there is a wide range of options to explore.

We can ask ourselves the following natural questions:

- ▶ What happens if we impose some conditions on R (for example, reflexivity, symmetry, transitivity, etc.)?
- ▶ What is the impact of these conditions on the notions of necessity and possibility?
- ▶ What principles or rules are justified by these conditions?

Validity in a frame is one of the key concepts in modal logic.

Definition 2.15

Let \mathcal{F} be a frame and φ be a formula.

- ▶ φ is **valid at a state** w in \mathcal{F} if φ is true at w in every model $\mathcal{M} = (\mathcal{F}, V)$ based on \mathcal{F} .
- ▶ φ is **valid in** \mathcal{F} if it is valid at every state w in \mathcal{F} .

Notation: $\mathcal{F} \Vdash \varphi$

Hence, a formula is valid in a frame if it is true at every state in every model based on the frame.

Validity in a frame differs in an essential way from the truth in a model. Let us give a simple example.

Example 2.16

If $\varphi \vee \psi$ is true in a model \mathcal{M} at w , then φ is true in \mathcal{M} at w or ψ is true in \mathcal{M} at w (by Proposition 2.10).

On the other hand, if $\varphi \vee \psi$ is valid in a frame \mathcal{F} at w , it does not follow that φ is valid in \mathcal{F} at w or ψ is valid in \mathcal{F} at w ($p \vee \neg p$ is a counterexample).

Definition 2.17

Let \mathbf{M} be a class of models, \mathbf{F} be a class of frames and φ be a formula. We say that

- ▶ φ is **true in \mathbf{M}** if it is true in every model in \mathbf{M} .
Notation: $\mathbf{M} \models \varphi$
- ▶ φ is **valid in \mathbf{F}** if it is valid in every frame in \mathbf{F} .
Notation: $\mathbf{F} \models \varphi$

Definition 2.18

The set of all formulas of ML_0 that are valid in a class of frames \mathbf{F} is called the **logic of \mathbf{F}** and is denoted by $\Lambda_{\mathbf{F}}$.

61

Example 2.19

Formulas $\Diamond(p \vee q) \rightarrow (\Diamond p \vee \Diamond q)$ and $\Box(p \rightarrow q) \rightarrow (\Box p \rightarrow \Box q)$ are valid in the class of all frames.

Proof: Let $\mathcal{F} = (W, R)$ be an arbitrary frame, w a state in \mathcal{F} and $\mathcal{M} = (\mathcal{F}, V)$ be a model based on \mathcal{F} . We have to show that

$$\mathcal{M}, w \models \Diamond(p \vee q) \rightarrow (\Diamond p \vee \Diamond q).$$

Suppose that $\mathcal{M}, w \models \Diamond(p \vee q)$. Then there exists $v \in W$ such that Rwv and $\mathcal{M}, v \models p \vee q$. We have two cases:

- ▶ $\mathcal{M}, v \models p$. Then $\mathcal{M}, w \models \Diamond p$, so $\mathcal{M}, w \models \Diamond p \vee \Diamond q$.
- ▶ $\mathcal{M}, v \models q$. Then $\mathcal{M}, w \models \Diamond q$, so $\mathcal{M}, w \models \Diamond p \vee \Diamond q$.

We let as an exercise to prove that $\Box(p \rightarrow q) \rightarrow (\Box p \rightarrow \Box q)$ is valid in the class of all frames. □

62

Example 2.20

Formula $\Box p \rightarrow \Box \Box p$ is not valid in the class of all frames.

Proof: We have to find a frame $\mathcal{F} = (W, R)$, a state w in \mathcal{F} and a model $\mathcal{M} = (\mathcal{F}, V)$ such that

$$\mathcal{M}, w \not\models \Box p \rightarrow \Box \Box p.$$

Consider the following frame: $\mathcal{F} = (W, R)$, where

$$W = \{0, 1, 2\}, \quad R = \{(0, 1), (1, 2)\}$$

and take a valuation V such that $V(p) = \{1\}$. Then $\mathcal{M}, 0 \models \Box p$, since 1 is the only state R -accessible from 0 and $\mathcal{M}, 1 \models p$, as $1 \in V(p)$.

On the other hand, $\mathcal{M}, 0 \not\models \Box \Box p$, since $R^2 0 2$ and $\mathcal{M}, 2 \not\models p$, as $2 \notin V(p)$. □

63

Definition 2.21

We say that a frame $\mathcal{F} = (W, R)$ is **transitive** if R is transitive.

Example 2.22

Formula $\Box p \rightarrow \Box \Box p$ is valid in the class of all transitive frames.

Proof: Let $\mathcal{F} = (W, R)$ be a transitive frame, w a state in \mathcal{F} and $\mathcal{M} = (\mathcal{F}, V)$ be a model based on \mathcal{F} . Assume that $\mathcal{M}, w \models \Box p$. Then for all $v \in W$,

$$(*) \quad R w v \text{ implies } \mathcal{M}, v \models p.$$

Let us prove that $\mathcal{M}, w \models \Box \Box p$. Let $u, u' \in W$ be such that $R w u'$ and $R u' u$. We have to prove that $\mathcal{M}, u \models p$. Since R is transitive, it follows that $R w u$. Applying $(*)$ with $v := u$ we get that $\mathcal{M}, u \models p$. □

64

We introduce the **consequence relation**.

The basic ideas are the following;

- ▶ A relation of semantic consequence holds when the truth of the premises guarantees the truth of the conclusion.
- ▶ The inferences depend on the class of structures we are working with. (For example, inferences for transitive frames must be different than the ones for intransitive frames.)

Thus, the definition of the consequence relation must make reference to a class of structures **S**.

65

Let **S** be a class of **structures** (frames or models) for ML_0 .
If **S** is a class of models, then a model **from S** is simply an element \mathcal{M} of **S**. If **S** is a class of frames, then a model **from S** is a model based on a frame in **S**.

Definition 2.23

Let Σ be a set of formulas and φ be a formula. We say that φ is a **semantic consequence of Σ over S** if for all models \mathcal{M} from **S** and all states w in \mathcal{M} ,

$$\mathcal{M}, w \Vdash \Sigma \quad \text{implies} \quad \mathcal{M}, w \Vdash \varphi.$$

Notation: $\Sigma \Vdash_S \varphi$

Thus, if Σ is true at a state of the model, then φ must be true **at the same state**.

66

Remark 2.24

$$\{\psi\} \Vdash_S \varphi \text{ iff } S \Vdash \psi \rightarrow \varphi.$$

Example 2.25

Let *Tran* be the class of transitive frames. Then

$$\{\Box\varphi\} \Vdash_{Tran} \Box\Box\varphi.$$

But $\Box\Box\varphi$ is **NOT** a semantic consequence of $\Box\varphi$ over the class of **all** frames.

67

Definition 2.26

A **normal modal logic** is a set Λ of formulas of ML_0 satisfying the following properties:

- ▶ Λ contains the following **axioms**:

$$\begin{aligned} (\text{Taut}) \quad & \text{all propositional tautologies,} \\ (K) \quad & \Box(\varphi \rightarrow \psi) \rightarrow (\Box\varphi \rightarrow \Box\psi), \end{aligned}$$

where φ, ψ are formulas of ML_0 .

- ▶ Λ is closed under the following deduction rules:

$$\text{modus ponens (MP): } \frac{\varphi, \varphi \rightarrow \psi}{\psi}.$$

Hence, if $\varphi \in \Lambda$ and $\varphi \rightarrow \psi \in \Lambda$, then $\psi \in \Lambda$.

$$\text{generalization or necessitation (GEN): } \frac{\varphi}{\Box\varphi}.$$

Hence, if $\varphi \in \Lambda$, then $\Box\varphi \in \Lambda$.

68

Normal modal logics - tautologies

We add all propositional tautologies as axioms for simplicity, it is not necessary. We could add a small number of tautologies, which generates all of them. For example,

- (A1) $\varphi \rightarrow (\psi \rightarrow \varphi)$
- (A2) $(\varphi \rightarrow (\psi \rightarrow \chi)) \rightarrow ((\varphi \rightarrow \psi) \rightarrow (\varphi \rightarrow \chi))$
- (A3) $(\neg\psi \rightarrow \neg\varphi) \rightarrow (\varphi \rightarrow \psi).$

Proposition 2.27

Any propositional tautology is valid in the class of all frames for ML_0 .

Remark 2.28

Tautologies may contain modalities, too. For example, $\Diamond\psi \vee \neg\Diamond\psi$ is a tautology, since it has the same form as $\varphi \vee \neg\varphi$.

69

Normal modal logics - axiom (K)

Axiom (K) is sometimes called the **distribution axiom** and it is important because it allows us to transform $\Box(\varphi \rightarrow \psi)$ (a boxed formula) in an implication $\Box\varphi \rightarrow \Box\psi$, enabling further pure propositional reasoning to take place.

For example, assume that we want to prove $\Box\psi$ and we already have a proof that contains both $\Box(\varphi \rightarrow \psi)$ and $\Box\varphi$. Applying (K) and modus ponens, we get $\Box\varphi \rightarrow \Box\psi$. Applying again modus ponens, we obtain $\Box\psi$.

By Example 2.19,

Proposition 2.29

(K) is valid in the class of all frames for ML_0 .

70

Normal modal logics

Theorem 2.30

For any class F of frames, Λ_F , the logic of F , is a normal modal logic.

Lemma 2.31

- The collection of all formulas is a normal modal logic, called the **inconsistent logic**.
- If $\{\Lambda_i \mid i \in I\}$ is a collection of normal modal logics, then $\bigcap_{i \in I} \Lambda_i$ is a normal modal logic.

Definition 2.32

K is the intersection of all normal modal logics.

Hence, K is the smallest normal modal logic.

71

K

Definition 2.33

A **K-proof** is a sequence of formulas $\theta_1, \dots, \theta_n$ such that for any $i \in \{1, \dots, n\}$, one of the following conditions is satisfied:

- θ_i is an axiom (that is, a tautology or (K));
- θ_i is obtained from previous formulas by applying modus ponens or generalization.

Definition 2.34

Let φ be a formula. A **K-proof** of φ is a K-proof $\theta_1, \dots, \theta_n$ such that $\theta_n = \varphi$.

If φ has a K-proof, we say that φ is **K-provable**.

Notation: $\vdash_K \varphi$.

Theorem 2.35

$$K = \{\varphi \mid \vdash_K \varphi\}.$$

72

K

Definition 2.36

Let $\varphi, \psi_1, \dots, \psi_n$ ($n \geq 1$) be formulas. We say that φ is **deducible in propositional logic** from ψ_1, \dots, ψ_n if

$\psi_1 \wedge \dots \wedge \psi_n \rightarrow \varphi$ is a tautology.

Lemma 2.37

Let $\varphi, \psi_1, \dots, \psi_n$ ($n \geq 1$) be formulas. The following are equivalent:

- φ is deducible in propositional logic from ψ_1, \dots, ψ_n .
- $\psi_1 \rightarrow (\psi_2 \rightarrow \dots \rightarrow (\psi_n \rightarrow \varphi))$ is a tautology.

Proof: Use the fact that

$(\psi_1 \wedge \dots \wedge \psi_n \rightarrow \varphi) \leftrightarrow (\psi_1 \rightarrow (\psi_2 \rightarrow \dots \rightarrow (\psi_n \rightarrow \varphi)))$ is a tautology.

73

K

Proposition 2.38

K is closed under propositional deduction: if φ is deducible in propositional logic from assumptions ψ_1, \dots, ψ_n , then

$\vdash_K \psi_1, \dots, \vdash_K \psi_n$ implies $\vdash_K \varphi$.

Proof:

- | | | |
|--------|---|--|
| (1) | $\vdash_K \psi_1$ | hypothesis |
| | \vdots | |
| (n) | $\vdash_K \psi_n$ | hypothesis |
| (n+1) | $\vdash_K \psi_1 \rightarrow (\psi_2 \rightarrow \dots \rightarrow (\psi_n \rightarrow \varphi))$ | (Taut) |
| (n+2) | $\vdash_K \psi_2 \rightarrow \dots \rightarrow (\psi_{n-1} \rightarrow (\psi_n \rightarrow \varphi))$ | (MP): (1), (n+1) |
| | \vdots | |
| (2n-1) | $\vdash_K \psi_{n-1} \rightarrow (\psi_n \rightarrow \varphi)$ | (MP): (n-2), (2n-2) |
| (2n) | $\vdash_K \psi_n \rightarrow \varphi$ | (MP): (n-1), (2n-1) |
| (2n+1) | $\vdash_K \varphi$ | (MP): (n), (2n) □ |

74

K

Proposition 2.39

Assume that $\vdash_K \varphi \rightarrow \psi$ and that $\vdash_K \psi \rightarrow \chi$. Then $\vdash_K \varphi \rightarrow \chi$.

Proof: Apply Proposition 2.38 and the fact that $\varphi \rightarrow \chi$ is deducible in propositional logic from assumptions $\varphi \rightarrow \psi, \psi \rightarrow \chi$, as $(\varphi \rightarrow \psi) \wedge (\psi \rightarrow \chi) \rightarrow (\varphi \rightarrow \chi)$ is a tautology. □

Proposition 2.40

Assume that $\vdash_K \varphi \rightarrow \psi$ and that $\vdash_K \varphi \rightarrow \chi$. Then $\vdash_K \varphi \rightarrow \psi \wedge \chi$.

Proof: Apply Proposition 2.38 and the fact that $\varphi \rightarrow \psi \wedge \chi$ is deducible in propositional logic from assumptions $\varphi \rightarrow \psi, \varphi \rightarrow \chi$, as $(\varphi \rightarrow \psi) \wedge (\varphi \rightarrow \chi) \rightarrow (\varphi \rightarrow \psi \wedge \chi)$ is a tautology. □

75

K

Proposition 2.41

$\vdash_K \varphi \rightarrow (\psi \rightarrow \chi)$ iff $\vdash_K \varphi \wedge \psi \rightarrow \chi$.

Proof: Apply Proposition 2.38 and the fact that

$(\varphi \rightarrow (\psi \rightarrow \chi)) \sim (\varphi \wedge \psi \rightarrow \chi)$,

hence

$(\varphi \rightarrow (\psi \rightarrow \chi)) \rightarrow (\varphi \wedge \psi \rightarrow \chi), (\varphi \wedge \psi \rightarrow \chi) \rightarrow (\varphi \rightarrow (\psi \rightarrow \chi))$ are tautologies. □

Proposition 2.42

Assume that $\vdash_K \varphi \rightarrow \psi$ and $\vdash_K \psi \rightarrow \varphi$. Then $\vdash_K \varphi \leftrightarrow \psi$.

Proof: Apply Proposition 2.38 and the fact that $\varphi \leftrightarrow \psi$ is deducible in propositional logic from assumptions $\varphi \rightarrow \psi, \psi \rightarrow \varphi$, as $(\varphi \rightarrow \psi) \wedge (\psi \rightarrow \varphi) \rightarrow (\varphi \leftrightarrow \psi)$ is a tautology. □

76

K

Example 2.43

$\vdash_K \varphi \rightarrow \psi$ implies $\vdash_K \Box\varphi \rightarrow \Box\psi$.

Proof: We give the following **K**-proof:

- | | |
|--|-----------------|
| (1) $\vdash_K \varphi \rightarrow \psi$ | hypothesis |
| (2) $\vdash_K \Box(\varphi \rightarrow \psi)$ | (GEN): (1) |
| (3) $\vdash_K \Box(\varphi \rightarrow \psi) \rightarrow (\Box\varphi \rightarrow \Box\psi)$ | (K) |
| (4) $\vdash_K \Box\varphi \rightarrow \Box\psi$ | (MP): (2), (3). |

□

77

K

Example 2.44

$\vdash_K \varphi \rightarrow \psi$ implies $\vdash_K \Diamond\varphi \rightarrow \Diamond\psi$.

Proof: We give the following **K**-proof:

- | | |
|--|--------------------------|
| (1) $\vdash_K \varphi \rightarrow \psi$ | hypothesis |
| (2) $\vdash_K (\varphi \rightarrow \psi) \rightarrow (\neg\psi \rightarrow \neg\varphi)$ | (Taut) |
| (3) $\vdash_K \neg\psi \rightarrow \neg\varphi$ | (MP): (1), (2) |
| (4) $\vdash_K \Box\neg\psi \rightarrow \Box\neg\varphi$ | Example 2.43: (3) |
| (5) $\vdash_K (\Box\neg\psi \rightarrow \Box\neg\varphi) \rightarrow (\neg\Box\neg\varphi \rightarrow \neg\Box\neg\psi)$ | (Taut) |
| (6) $\vdash_K \neg\Box\neg\varphi \rightarrow \neg\Box\neg\psi$ | (MP): (4), (5) |
| (7) $\vdash_K \Diamond\varphi \rightarrow \Diamond\psi$ | definition of \Diamond |

□

78

K

Example 2.45

$\vdash_K \Box(\varphi \wedge \psi) \rightarrow \Box\varphi \wedge \Box\psi$.

Proof: We give the following **K**-proof:

- | | |
|--|-------------------------------|
| (1) $\vdash_K \varphi \wedge \psi \rightarrow \varphi$ | (Taut) |
| (2) $\vdash_K \Box(\varphi \wedge \psi) \rightarrow \Box\varphi$ | Example 2.43: (1) |
| (3) $\vdash_K \varphi \wedge \psi \rightarrow \psi$ | (Taut) |
| (4) $\vdash_K \Box(\varphi \wedge \psi) \rightarrow \Box\psi$ | Example 2.43: (3) |
| (5) $\vdash_K \Box(\varphi \wedge \psi) \rightarrow \Box\varphi \wedge \Box\psi$ | Proposition 2.40, (2) and (4) |

□

79

K

Example 2.46

$\vdash_K \Box\varphi \wedge \Box\psi \rightarrow \Box(\varphi \wedge \psi)$.

Proof: We give the following **K**-proof:

- | | |
|--|----------------------|
| (1) $\vdash_K \varphi \rightarrow (\psi \rightarrow (\varphi \wedge \psi))$ | (Taut) |
| (2) $\vdash_K \Box\varphi \rightarrow \Box(\psi \rightarrow (\varphi \wedge \psi))$ | Ex. 2.43: (1) |
| (3) $\vdash_K \Box(\psi \rightarrow (\varphi \wedge \psi)) \rightarrow (\Box\psi \rightarrow \Box(\varphi \wedge \psi))$ | (K) |
| (4) $\vdash_K \Box\varphi \rightarrow (\Box\psi \rightarrow \Box(\varphi \wedge \psi))$ | Prop. 2.39, (2), (3) |
| (5) $\vdash_K \Box\varphi \wedge \Box\psi \rightarrow \Box(\varphi \wedge \psi)$ | Prop. 2.41, (4) |

□

80

K

Example 2.47

$$\vdash_K \Box\varphi \wedge \Box\psi \leftrightarrow \Box(\varphi \wedge \psi).$$

Proof: We give the following **K**-proof:

- (1) $\vdash_K \Box\varphi \wedge \Box\psi \rightarrow \Box(\varphi \wedge \psi)$ Example 2.46
- (2) $\vdash_K \Box(\varphi \wedge \psi) \rightarrow \Box\varphi \wedge \Box\psi$ Example 2.45
- (3) $\vdash_K \Box\varphi \wedge \Box\psi \leftrightarrow \Box(\varphi \wedge \psi)$ Proposition 2.42, (1), (2)

□

81

K

The logic **K** is very weak. If we are interested in transitive frames, we would like a proof system which reflects this. For example, we know that $\Box\varphi \rightarrow \Box\Box\varphi$ is valid in the class of all transitive frames, so we would want a proof system that generates this formula.

K does not do this, since $\Box\varphi \rightarrow \Box\Box\varphi$ is not valid in the class of all frames.

The idea is to extend **K** with additional axioms.

82

K Γ

By Lemma 2.31, for any set Γ of formulas, there exists the smallest normal modal logic that contains Γ .

Definition 2.48

K Γ is the smallest normal modal logic that contains Γ . We say that **K Γ** is *generated* by Γ or *axiomatized* by Γ .

Definition 2.49

A **K Γ -proof** is a sequence of formulas $\theta_1, \dots, \theta_n$ such that for any $i \in \{1, \dots, n\}$, one of the following conditions is satisfied:

- ▶ θ_i is an axiom (that is, a tautology or (K));
- ▶ $\theta_i \in \Gamma$;
- ▶ θ_i is obtained from previous formulas by applying *modus ponens* or *generalization*.

83

K Γ

Definition 2.50

Let φ be a formula. A **K Γ -proof of φ** is a **K Γ -proof** $\theta_1, \dots, \theta_n$ such that $\theta_n = \varphi$.

If φ has a **K Γ -proof**, we say that φ is **K Γ -provable**.

Notation: $\vdash_{K\Gamma} \varphi$.

Theorem 2.51

$$K\Gamma = \{\varphi \mid \vdash_{K\Gamma} \varphi\}.$$

84

Let Λ be a normal modal logic.

Definition 2.52

If $\varphi \in \Lambda$, we also say that φ is a Λ -theorem or a theorem of Λ and write $\vdash_{\Lambda} \varphi$. If $\varphi \notin \Lambda$, we write $\nvdash_{\Lambda} \varphi$.

With these notations, the conditions from the definition of a normal modal logic are written as follows:

For any formulas φ, ψ , the following hold:

- (i) If φ is a tautology, then $\vdash_{\Lambda} \varphi$.
- (ii) $\vdash_{\Lambda} (K)$.
- (iii) If $\vdash_{\Lambda} \varphi$ and $\vdash_{\Lambda} \varphi \rightarrow \psi$, then $\vdash_{\Lambda} \psi$.
- (iv) If $\vdash_{\Lambda} \varphi$, then $\vdash_{\Lambda} \Box \varphi$.

85

Remark 2.53

- $\vdash_K \varphi$ implies $\vdash_{\Lambda} \varphi$.
- If $\Gamma \subseteq \Lambda$, then $\vdash_{K\Gamma} \varphi$ implies $\vdash_{\Lambda} \varphi$.

Proposition 2.54

Λ is closed under propositional deduction: if φ is deducible in propositional logic from assumptions ψ_1, \dots, ψ_n , then

$$\vdash_{\Lambda} \psi_1, \dots, \vdash_{\Lambda} \psi_n \text{ implies } \vdash_{\Lambda} \varphi.$$

Proof: Exercise.

86

Definition 2.55

Let $\Gamma \cup \{\varphi\}$ be a set of formulas. We say that φ is *deducible in Λ from Γ* or that φ is *Λ -deducible from Γ* if there exist formulas $\psi_1, \dots, \psi_n \in \Gamma$ ($n \geq 0$) such that

$$\vdash_{\Lambda} (\psi_1 \wedge \dots \wedge \psi_n) \rightarrow \varphi.$$

(When $n = 0$, this means that $\vdash_{\Lambda} \varphi$).

Notation: $\Gamma \vdash_{\Lambda} \varphi$ We write $\Gamma \nvdash_{\Lambda} \varphi$ if φ is not Λ -deducible from Γ .

Remark 2.56

The following are equivalent:

- (i) $\Gamma \vdash_{\Lambda} \varphi$.
- (ii) There exist formulas $\psi_1, \dots, \psi_n \in \Gamma$ ($n \geq 0$) such that

$$\vdash_{\Lambda} \psi_1 \rightarrow (\psi_2 \rightarrow \dots \rightarrow (\psi_n \rightarrow \varphi)).$$

87

Proposition 2.57 (Basic properties)

Let φ be a formula and Γ, Δ be sets of formulas.

- (i) $\emptyset \vdash_{\Lambda} \varphi$ iff $\vdash_{\Lambda} \varphi$.
- (ii) $\vdash_{\Lambda} \varphi$ implies $\Gamma \vdash_{\Lambda} \varphi$.
- (iii) $\varphi \in \Gamma$ implies $\Gamma \vdash_{\Lambda} \varphi$.
- (iv) If $\Gamma \vdash_{\Lambda} \varphi$ and $\Gamma \subseteq \Delta$, then $\Delta \vdash_{\Lambda} \varphi$.

Proof: Exercise.

88

Normal modal logics

Let φ, ψ be formulas and Γ be a set of formulas.

Proposition 2.58

$\Gamma \vdash_{\Lambda} \varphi$ iff there exists a finite subset Σ of Γ such that $\Sigma \vdash_{\Lambda} \varphi$.

Proposition 2.59

- (i) If $\Gamma \vdash_{\Lambda} \varphi$ and ψ is deducible in propositional logic from φ , then $\Gamma \vdash_{\Lambda} \psi$.
- (ii) If $\Gamma \vdash_{\Lambda} \varphi$ and $\Gamma \vdash_{\Lambda} \varphi \rightarrow \psi$, then $\Gamma \vdash_{\Lambda} \psi$.
- (iii) If $\Gamma \vdash_{\Lambda} \varphi$ and $\{\varphi\} \vdash_{\Lambda} \psi$, then $\Gamma \vdash_{\Lambda} \psi$.

Proposition 2.60 (Deduction Theorem)

For any set of formulas Γ and any formulas φ, ψ ,

$$\Gamma \vdash_{\Lambda} \varphi \rightarrow \psi \quad \text{iff} \quad \Gamma \cup \{\varphi\} \vdash_{\Lambda} \psi.$$

89

Consistent sets

Definition 2.61

A set Γ of formulas is **Λ -consistent** if there exists a formula φ such that $\Gamma \not\vdash_{\Lambda} \varphi$.

Γ is said to be **Λ -inconsistent** if it is not Λ -consistent, that is $\Gamma \vdash_{\Lambda} \varphi$ for any formula φ .

Proposition 2.62

Let Γ be a set of formulas. The following are equivalent:

- (i) Γ is Λ -inconsistent.
- (ii) There exists a formula ψ such that $\Gamma \vdash_{\Lambda} \psi$ and $\Gamma \vdash_{\Lambda} \neg\psi$.
- (iii) $\Gamma \vdash_{\Lambda} \perp$.

Proposition 2.63

Γ is Λ -consistent iff any finite subset of Γ is Λ -consistent.

90

Normal logics - soundness

In the following, we say “normal logic” instead of “normal modal logic”.

Let \mathbf{S} be a class of **structures** (frames or models) for ML_0 .

Notation:

$$\Lambda_{\mathbf{S}} := \{\varphi \mid \mathcal{S} \Vdash \varphi \text{ for any structure } \mathcal{S} \text{ from } \mathbf{S}\}.$$

Definition 2.64

A normal logic Λ is **sound** with respect to \mathbf{S} if $\Lambda \subseteq \Lambda_{\mathbf{S}}$.

Thus, Λ is sound with respect to \mathbf{S} iff for any formula φ and for any structure \mathcal{S} in \mathbf{S} ,

$$\vdash_{\Lambda} \varphi \quad \text{implies} \quad \mathcal{S} \Vdash \varphi.$$

If Λ is sound with respect to \mathbf{S} , we say also that \mathbf{S} is a **class of frames (or models) for Λ** .

91

Normal logics - soundness

Theorem 2.65 (Soundness theorem for \mathbf{K})

\mathbf{K} is **sound** with respect to the class of all frames.

Proof: We apply Theorem 2.30 and the fact that \mathbf{K} is the least normal logic. □

92

Definition 2.66

A normal logic Λ is

(i) **strongly complete** with respect to \mathbf{S} if for any set of formulas $\Gamma \cup \{\varphi\}$,

$$\Gamma \Vdash_{\mathbf{S}} \varphi \text{ implies } \Gamma \vdash_{\Lambda} \varphi.$$

(ii) **weakly complete** with respect to \mathbf{S} if for any formula φ ,

$$\mathbf{S} \Vdash \varphi \text{ implies } \vdash_{\Lambda} \varphi.$$

Obviously, weak completeness is a particular case of strong completeness; just take $\Gamma = \emptyset$ in Definition 2.66.(i).

93

Remark 2.67

Λ is weakly complete with respect to \mathbf{S} iff $\Lambda_{\mathbf{S}} \subseteq \Lambda$.

If a normal logic Λ is both sound and weakly complete with respect to a class of structures \mathbf{S} , then there is a perfect match between the syntactic and semantic perspectives: $\Lambda = \Lambda_{\mathbf{S}}$.

Given a semantically specified normal logic $\Lambda_{\mathbf{S}}$ (that is, the logic of some class of structures of interest), a very important problem is to find a simple set of formulas Γ such that $\Lambda_{\mathbf{S}}$ is the logic generated by Γ ; we say that Γ **axiomatizes** \mathbf{S} .

94

Theorem 2.68

K is sound and strongly complete with respect to the class of all frames for ML_0 .

95

Let

$$(4) \quad \Box\varphi \rightarrow \Box\Box\varphi$$

We use the notation $K4$ for the normal logic generated by (4). Thus, $K4$ is the smallest normal logic that contains (4).

Theorem 2.69

$K4$ is sound and strongly complete with respect to the class of transitive frames.

96

Logic T

Let

$$(T) \quad \Box\varphi \rightarrow \varphi$$

We use the notation T for the normal logic generated by (T) .

Definition 2.70

We say that a frame $\mathcal{F} = (W, R)$ is **reflexive** if R is reflexive.

Theorem 2.71

T is sound and strongly complete with respect to the class of reflexive frames.

97

Logic B

Let

$$(B) \quad \varphi \rightarrow \Box\Diamond\varphi$$

We use the notation B for the normal logic KB generated by (B) .

Definition 2.72

We say that a frame $\mathcal{F} = (W, R)$ is **symmetric** if R is symmetric.

Theorem 2.73

B is sound and strongly complete with respect to the class of symmetric frames.

98

Logic KD

Let

$$(D) \quad \Box\varphi \rightarrow \Diamond\varphi$$

and KD be the normal logic generated by (D) .

Remark 2.74

Let

$$(D') \quad \neg\Box(\varphi \wedge \neg\varphi).$$

Then $KD = KD'$.

Definition 2.75

We say that a frame $\mathcal{F} = (W, R)$ is **serial** if for all $w \in W$ there exists $v \in W$ such that Rwv .

Theorem 2.76

KD is sound and strongly complete with respect to the class of serial frames.

99

Logic $K5$

Let

$$(5) \quad \Diamond\varphi \rightarrow \Box\Diamond\varphi$$

and $K5$ be the normal logic generated by (5) .

Remark 2.77

Let

$$(5') \quad \neg\Box\varphi \rightarrow \Box\neg\Box\varphi$$

Then $K5 = K5'$.

Definition 2.78

We say that a frame $\mathcal{F} = (W, R)$ is **Euclidean** if for all $w, v, u \in W$, Rwv and Rwu imply Rvu .

Theorem 2.79

$K5$ is sound and strongly complete with respect to the class of Euclidean frames.

100

Logic S4

We use the notation **S4** for the normal logic **KT4** generated by (T) and (4).

Theorem 2.80

S4 is sound and strongly complete with respect to the class of reflexive and transitive frames.

101

Logic S5

We use the notation **S5** for the normal logic **KT4B** generated by (T), (4) and (B).

Proposition 2.81

S5 = **KDB4** = **KDB5** = **KT5**.

Theorem 2.82

S5 is sound and strongly complete with respect to the class of frames whose relation is an equivalence relation.

102

Multimodal logics

The whole theory presented so far adapts easily to languages with more modal operators.

Let I be a nonempty set.

- ▶ The **multimodal language** ML_I consists of: a set $PROP$ of atomic propositions, \neg , \rightarrow , the parentheses (,) and a set of modal operators $\{\Box_i \mid i \in I\}$.
- ▶ Formulas of ML_I are defined, using the Backus-Naur notation, as follows:

$$\varphi ::= p \mid (\neg\varphi) \mid (\varphi \rightarrow \varphi) \mid (\Box_i\varphi),$$

where $p \in PROP$ and $i \in I$.

- ▶ The dual of \Box_i is denoted by \Diamond_i and is defined as:

$$\Diamond_i\varphi := \neg\Box_i\neg\varphi$$

103

Multimodal logics

- ▶ A **frame** for ML_I is a relational structure $\mathcal{F} = (W, \{R_i \mid i \in I\})$, where R_i is a binary relation on W for every $i \in I$.
- ▶ A **model** for ML_I is, as previously, a pair $\mathcal{M} = (\mathcal{F}, V)$, where \mathcal{F} is a frame and $V : PROP \rightarrow 2^W$ is a valuation.
- ▶ The last clause from the definition of the satisfaction relation $\mathcal{M}, w \Vdash \varphi$ is changed to: for all $i \in I$,
 $\mathcal{M}, w \Vdash \Box_i\varphi$ iff for every $v \in W$, $R_i wv$ implies $\mathcal{M}, v \Vdash \varphi$.
- ▶ It follows that
 $\mathcal{M}, w \Vdash \Diamond_i\varphi$ iff there exists $v \in W$ s.t. $R_i wv$ and $\mathcal{M}, v \Vdash \varphi$.
- ▶ The definitions of **truth in a model** ($\mathcal{M} \Vdash \varphi$), of **validity in a frame** ($\mathcal{F} \Vdash \varphi$) and of the **consequence relation** are unchanged.

104

Definition 2.83

A **normal multimodal logic** is a set Λ of formulas of ML_I satisfying the following properties:

- ▶ Λ contains all propositional tautologies and is closed under modus ponens.

- ▶ Λ contains all formulas

$$(K_i) \quad \Box_i(\varphi \rightarrow \psi) \rightarrow (\Box_i\varphi \rightarrow \Box_i\psi),$$

where φ, ψ are formulas and $i \in I$.

- ▶ Λ is closed under generalization: for any formula φ and all $i \in I$,

$$\frac{\varphi}{\Box_i\varphi}.$$

105

- ▶ We use the same notation, **K**, for the smallest normal multimodal logic.
- ▶ We define similarly **K-proofs** and we also have that $K = \{\varphi \mid \vdash_K \varphi\}$.
- ▶ The multimodal logic generated by a set of formulas Γ is also denoted by **K** Γ . Furthermore, $K\Gamma = \{\varphi \mid \vdash_{K\Gamma} \varphi\}$.
- ▶ The definitions of **Λ -deducibility**, **Λ -consistence**, **soundness** and **weak and strong completeness** are unchanged.

106

Epistemic Logics

Textbook:

R. Fagin, J.Y. Halpern, Y. Moses, M. Vardi, **Reasoning About Knowledge**, MIT Press, 2004

107

In epistemic logics, the multimodal language is used to reason about knowledge. Let $n \geq 1$ and $Ag = \{1, \dots, n\}$ be the set of agents.

- ▶ We consider the multimodal language ML_{Ag} .
- ▶ We write, for every $i = 1, \dots, n$, **$K_i\varphi$** instead of $\Box_i\varphi$.
- ▶ $K_i\varphi$ is read as **the agent i knows (that) φ** .
- ▶ We denote by \hat{K}_i the dual operator: $\hat{K}_i\varphi = \neg K_i\neg\varphi$.
- ▶ Then $\hat{K}_i\varphi$ is read as **the agent i considers possible (that) φ** .

108

Definition 3.1

An **epistemic logic** is a set Λ of formulas of ML_{Ag} satisfying the following properties:

- ▶ Λ contains all propositional tautologies and is closed under modus ponens.
- ▶ Λ contains all formulas

$$K_i(\varphi \rightarrow \psi) \rightarrow (K_i\varphi \rightarrow K_i\psi),$$

where φ, ψ are formulas and $i \in Ag$.

- ▶ Λ is closed under generalization: for any formula φ and all $i \in Ag$,

$$\frac{\varphi}{K_i\varphi}.$$

We denote by **K** the smallest epistemic logic.

109

Recall the following axioms:

$$(T) \quad K_i\varphi \rightarrow \varphi$$

$$(D') \quad \neg K_i(\varphi \wedge \neg\varphi)$$

$$(B) \quad \varphi \rightarrow K_i\neg K_i\neg\varphi$$

Properties of knowledge

- ▶ Axiom (T) is called the **verity** or **knowledge** axiom: If an agent knows φ , then φ must hold. **What is known is true.** This is often taken to be the property that distinguishes knowledge from other informational attitudes, such as belief.
- ▶ Axiom (D') is the **consistency** axiom: an agent does not know both φ and $\neg\varphi$. **An agent cannot know a contradiction.**
- ▶ Axiom (B) says that if φ holds, then an agent knows that it does not know $\neg\varphi$.

110

Recall the following axioms:

$$(4) \quad K_i\varphi \rightarrow K_iK_i\varphi$$

$$(5') \quad \neg K_i\varphi \rightarrow K_i\neg K_i\varphi$$

Properties of knowledge

- ▶ Axiom (4) is **positive introspection**: if an agent knows φ , it knows that it knows φ . **An agent knows what it knows.**
- ▶ Axiom (5') is **negative introspection**: if an agent does not know φ , it knows that it does not know φ . **An agent is aware of what it doesn't know.**
- ▶ Positive and negative introspection together imply that an agent has perfect knowledge about what it does and does not know.

111

Let **S5** = **KD'B4** = **KD'B5'** = **KT5'**. **S5** is considered as the logic of **idealised knowledge**.

Theorem 3.2

S5 is sound and strongly complete with respect to the class of frames whose relations are equivalence relations.

112

A model $M = (W, \mathcal{K}_1, \dots, \mathcal{K}_n, V)$ is represented as a labeled directed graph:

- ▶ the nodes of the graph are the states of the model;
- ▶ the label of each node $w \in W$ describes which atomic propositions are true at state w ;
- ▶ we label edges by sets of agents; the label of the edge from node w to node v includes i iff $\mathcal{K}_i wv$ holds.

113

Example

We have that $Ag = \{1, 2\}$, $PROP = \{p\}$ and $\mathcal{M} = (W, \mathcal{K}_1, \mathcal{K}_2, V)$, where

- ▶ $W = \{s, t, u\}$.
- ▶ $\mathcal{K}_1 = \{(s, s), (t, t), (u, u), (s, t), (t, s)\}$.
- ▶ $\mathcal{K}_2 = \{(s, s), (t, t), (u, u), (s, u), (u, s)\}$.
- ▶ $V(p) = \{s, u\}$.

114

Example

- ▶ $\mathcal{M}, s \models p \wedge \neg K_1 p$.

Proof: We have that $s \in V(p)$, hence $\mathcal{M}, s \models p$. Since $\mathcal{K}_1 st$ and $\mathcal{M}, t \not\models p$, it follows that $\mathcal{M}, s \not\models K_1 p$, hence $\mathcal{M}, s \models \neg K_1 p$. Thus, $\mathcal{M}, s \models p \wedge \neg K_1 p$. \square

In state s , p is true, but agent 1 does not know it, since in state s it considers both s and t possible. We say that agent 1 cannot distinguish s from t . Agent 1's information is insufficient to enable it to distinguish whether the actual state is s or t .

115

Example

- ▶ $\mathcal{M}, s \models K_2 p$.

Proof: We have that $\mathcal{M}, s \models K_2 p$ iff for all $v \in W$, $\mathcal{K}_2 sv$ implies $\mathcal{M}, v \models p$ iff $\mathcal{M}, s \models p$ and $\mathcal{M}, u \models p$ (as $\mathcal{K}_2 ss$, $\mathcal{K}_2 su$, but we don't have that $\mathcal{K}_2 st$), which is true. \square

In state s , agent 2 knows that p is true, since p is true in both states that agent 2 considers possible at s (namely s and u).

116

Example

- $\mathcal{M}, s \models \neg K_2 \neg K_1 p$.

Proof: We have that $\mathcal{M}, s \models \neg K_2 \neg K_1 p$ iff $\mathcal{M}, s \not\models K_2 \neg K_1 p$ iff there exists $v \in W$ such that $\mathcal{K}_2 s v$ and $\mathcal{M}, v \not\models \neg K_1 p$ iff there exists $v \in W$ such that $\mathcal{K}_2 s v$ and $\mathcal{M}, v \models K_1 p$. Take $v := u$. Then $\mathcal{K}_2 s u$ and $\mathcal{M}, u \models K_1 p$, since $\mathcal{M}, u \models p$ and $\mathcal{K}_1 u w$ iff $w = u$. \square

117

$$Ag = \{1, 2\}$$

- Suppose that we have a deck consisting of three cards labeled A , B , and C . Agents 1 and 2 each get one of these cards; the third card is left face down.
- A possible world is characterized by describing the cards held by each agent. For example, in the world (A, B) , agent 1 holds card A and agent 2 holds card B (while card C is face down).
- The set of possible worlds is

$$W = \{(A, B), (A, C), (B, A), (B, C), (C, A), (C, B)\}.$$
- In a world such as (A, B) , agent 1 thinks two worlds are possible: (A, B) and (A, C) . Agent 1 knows that it has card A , but considers it possible that agent 2 could hold either card B or card C .

118

- Similarly, in world (A, B) , agent 2 also considers two worlds are possible: (A, B) and (C, B) .
- In general, in a world (X, Y) , agent 1 considers (X, Y) and (X, Z) possible, while agent 2 considers (X, Y) and (Z, Y) possible, where Z is different from both X and Y .
- We can easily construct the \mathcal{K}_1 and \mathcal{K}_2 relations.
- It is easy to check that they are indeed equivalence relations.
- This is because an agent's possibility relation is determined by the information it has, namely, the card it is holding.

119

We describe the frame $\mathcal{F}_c = (W, \mathcal{K}_1, \mathcal{K}_2)$ for the card game as a labeled graph. Since the relations are equivalence relations, we omit the self loops and the arrows on edges for simplicity (if there is an edge from state w to state v , there must be an edge from v to w as well, by symmetry).

Figure 1: Frame describing a simple card game

120

A simple card game

- ▶ In the world (A, B) , agent 1 knows that the world (B, C) cannot be the case. This is captured by the fact that there is no edge from (A, B) to (B, C) labeled 1.
- ▶ Nevertheless, agent 1 considers it possible that agent 2 considers it possible that (B, C) is the case. This is captured by the fact that there is an edge labeled 1 from (A, B) to (A, C) , from which there is an edge labeled 2 to (B, C) .

121

A simple card game

We still have not defined the model to be used in this example.

Define the set PROP of atomic propositions as

$$PROP = \{iX \mid i \in \{1, 2\}, X \in \{A, B, C\}\}.$$

iX will be interpreted as **agent i holds card X** . Given this interpretation, we define the valuation V in the obvious way:

$$V(iX) = \begin{cases} \{(X, Z) \mid Z \in \{A, B, C\} \setminus \{X\}\} & \text{if } i = 1 \\ \{(Z, X) \mid Z \in \{A, B, C\} \setminus \{X\}\} & \text{if } i = 2. \end{cases}$$

122

A simple card game

Let $\mathcal{M}_c = (\mathcal{F}_c, V)$ be the model describing this card game.

- ▶ $\mathcal{M}_c, (A, B) \models 1A \wedge 2B$.

Proof: $\mathcal{M}_c, (A, B) \models 1A \wedge 2B$ iff
 $\mathcal{M}_c, (A, B) \models 1A$ and $\mathcal{M}_c, (A, B) \models 2B$ iff
 $(A, B) \in V(1A)$ and $(A, B) \in V(2B)$, which is true.

123

A simple card game

- ▶ $\mathcal{M}_c, (A, B) \models K_1 \neg 2A$: agent 1 knows that agent 2 does not hold an A.

Proof: $\mathcal{M}_c, (A, B) \models K_1 \neg 2A$ iff
for all $(X, Y) \in \mathcal{M}_c$, $\mathcal{K}_1(A, B)(X, Y)$ implies $\mathcal{M}_c, (X, Y) \models \neg 2A$
iff $\mathcal{M}_c, (A, B) \models \neg 2A$ and $\mathcal{M}_c, (A, C) \models \neg 2A$ iff
 $\mathcal{M}_c, (A, B) \not\models 2A$ and $\mathcal{M}_c, (A, C) \not\models 2A$ iff
 $(A, B) \notin V(2A)$ and $(A, C) \notin V(2A)$ iff
 $(A, B), (A, C) \notin \{(B, A), (C, A)\}$, which is true. □

124

A simple card game

- $\mathcal{M}_c, (A, B) \models K_1 \neg K_2 1A$: agent 1 knows that agent 2 does not know that agent 1 holds an A.

Proof: $\mathcal{M}_c, (A, B) \models K_1 \neg K_2 1A$ iff for all $(X, Y) \in \mathcal{M}_c$, $K_1(A, B)(X, Y)$ implies $\mathcal{M}_c, (X, Y) \models \neg K_2 1A$ iff $\mathcal{M}_c, (A, B) \models \neg K_2 1A$ and $\mathcal{M}_c, (A, C) \models \neg K_2 1A$ iff $\mathcal{M}_c, (A, B) \not\models K_2 1A$ and $\mathcal{M}_c, (A, C) \not\models K_2 1A$ iff (there exists $(X, Y) \in \mathcal{M}_c$ such that $K_2(A, B)(X, Y)$ and $\mathcal{M}_c, (X, Y) \not\models 1A$) and (there exists $(Y, Z) \in \mathcal{M}_c$ such that $K_2(A, C)(Y, Z)$ and $\mathcal{M}_c, (Y, Z) \not\models 1A$)

125

A simple card game

Proof: (continued) $\mathcal{M}_c, (A, B) \models K_1 \neg K_2 1A$ iff (there exists $(X, Y) \in \mathcal{M}_c$ such that $K_2(A, B)(X, Y)$ and $\mathcal{M}_c, (X, Y) \not\models 1A$) and (there exists $(Y, Z) \in \mathcal{M}_c$ such that $K_2(A, C)(Y, Z)$ and $\mathcal{M}_c, (Y, Z) \not\models 1A$)

We have that $K_2(A, B)(C, B)$ and $\mathcal{M}_c, (C, B) \not\models 1A$, since $(C, B) \notin V(1A)$. Thus, we can take $(X, Y) = (C, B)$. We have that $K_2(A, C)(B, C)$ and $\mathcal{M}_c, (B, C) \not\models 1A$, since $(B, C) \notin V(1A)$. Thus, we can take $(Y, Z) = (B, C)$. □

126

A simple card game

- $\mathcal{M}_c, (A, B) \models K_1(2B \vee 2C)$: agent 1 knows that agent 2 holds either B or C.

Proof: Exercise.

- $\mathcal{M}_c, (A, B) \models K_2 \neg K_1 2B$: agent 2 knows that agent 1 does not know that agent 2 holds a B.

Proof: Exercise.

127

Common and distributed knowledge

We need to reason about **knowledge in a group** and using this understanding to help us analyze multiagent systems.

- An agent in a group must take into account not only facts that are true about the world, but also the knowledge of other agents in the group.
- For example, in a bargaining situation, the seller of a car must consider what the potential buyer knows about the car's value. The buyer must also consider what the seller knows about what the buyer knows about the car's value, and so on.
- Such reasoning can get rather convoluted. Example: "Dean doesn't know whether Nixon knows that Dean knows that Nixon knows that McCord burgled O'Brien's office at Watergate."
- But this is precisely the type of reasoning that is needed when analyzing the knowledge of agents in a group.

128

Common and distributed knowledge

We are often interested in situations in which **everyone** in the group knows a fact.

Example

A society certainly wants all drivers to know that a **red light** means **stop** and a **green light** means **go**. Suppose we assume that every driver in the society knows this fact and follows the rules. A driver does not feel safe, unless she also knows that everyone else knows and is following the rules. Otherwise, a driver may consider it possible that, although she knows the rules, some other driver does not, and that driver may run a red light.

129

Common and distributed knowledge

- ▶ In some cases we also need to consider the state in which simultaneously everyone knows a fact φ , everyone knows that everyone knows φ , everyone knows that everyone knows that everyone knows φ , and so on. We say that the group has **common knowledge** of φ .
- ▶ The notion of common knowledge was first studied by the philosopher **David Lewis** in the context of **conventions**: in order for something to be a convention, it must be common knowledge among the members of a group.
- ▶ John McCarthy, in the context of studying common-sense reasoning, characterized common knowledge as **what any fool knows**.

Example

The convention that **green** means **go** and **red** means **stop** is presumably common knowledge among the drivers in our society.

130

Common and distributed knowledge

- ▶ Common knowledge also arises in **discourse understanding**.
- ▶ Suppose that Ann asks Bob "What did you think of the movie?" referring to the movie Star Wars they have just seen. Ann and Bob must both know that **the movie** refers to **Star Wars**, Ann must know that Bob knows (so that she can be sure that Bob will give a reasonable answer to her question), Bob must know that Ann knows that Bob knows (so that Bob knows that Ann will respond appropriately to his answer), and so on.
- ▶ There must be common knowledge of what movie is meant in order for Bob to answer the question appropriately.
- ▶ Common knowledge also turns out to be a prerequisite for achieving agreement.
- ▶ That is why common knowledge is a crucial notion in the analysis of interacting groups of agents.

131

Common and distributed knowledge

A group has **distributed knowledge** of a fact φ if the knowledge of φ is distributed among its members, so that by using their knowledge together the members of the group can deduce φ , even though it may be the case that no member of the group individually knows φ .

Example

Assume that Alice knows that Bob is in love with either Carol or Susan, and Charlie knows that Bob is not in love with Carol. Then together Alice and Charlie have distributed knowledge of the fact that Bob is in love with Susan, although neither Alice nor Charlie individually has this knowledge.

132

Common and distributed knowledge

Let $\emptyset \neq G \subseteq Ag$ be a group of agents.

- Define, for every φ ,

$$E_G\varphi = \bigwedge_{i \in G} K_i\varphi.$$

- $E_G\varphi$ is read as **everyone in the group G knows φ** .
- For every model \mathcal{M} and every $w \in \mathcal{M}$,
 $\mathcal{M}, w \models E_G\varphi$ iff $\mathcal{M}, w \models K_i\varphi$ for all $i \in G$.

133

Common and distributed knowledge

The language ML_{Ag} does not allow us to express the notions of common knowledge and distributed knowledge.

Let ML_{Ag}^{CD} be the language obtained by adding to ML_{Ag} the following modal operators for any $\emptyset \neq G \subseteq Ag$:

- C_G , read as **it is common knowledge among the agents in G** ;
- D_G , read as **it is distributed knowledge among the agents in G** .

Formulas of ML_{Ag}^{CD} are defined as follows:

$$\varphi ::= p \mid \neg\varphi \mid \varphi \rightarrow \varphi \mid K_i\varphi \mid C_G\varphi \mid D_G\varphi,$$

where $p \in PROP$, $i \in Ag$ and $\emptyset \neq G \subseteq Ag$.

We omit the subscript G when G is the set of all agents.

134

Common and distributed knowledge

Let $\emptyset \neq G \subseteq Ag$ be a group of agents.

We define $E_G^k\varphi$ ($k \geq 0$) inductively:

$$E_G^0\varphi = \varphi, \quad E_G^{k+1}\varphi = E_G E_G^k\varphi.$$

Let \mathcal{M} be a model and $w \in \mathcal{M}$. We extend the definition of the satisfaction relation with the following clause:

$$\mathcal{M}, w \models C_G\varphi \text{ iff } \mathcal{M}, w \models E_G^k\varphi \text{ for all } k = 1, 2, \dots$$

Thus, the formula $C_G\varphi$ is true iff everyone in G knows φ , everyone in G knows that everyone in G knows φ , etc.

135

Common and distributed knowledge

Our definition of common knowledge has a graph-theoretical interpretation.

Let \mathcal{M} be a model.

Definition 3.3

Let w, v be states in \mathcal{M} .

- We say that v is **G -reachable from w in k steps** ($k \geq 1$) if there exist states $u_0, u_1, \dots, u_k \in \mathcal{M}$ such that $u_0 = w$, $u_k = v$ and for all $j = 0, \dots, k-1$, there exists $i \in G$ such that $K_i u_j u_{j+1}$.
- v is **G -reachable from w** if v is G -reachable from w in k steps for some $k \geq 1$.

Thus, v is G -reachable from w iff there is a path in the graph from w to v whose edges are labeled by members of G .

136

Proposition 3.4

Let w be a state in \mathcal{M} .

- ▶ The following are equivalent for every $k \geq 1$:
 - ▶ $\mathcal{M}, w \models E_G^k \varphi$;
 - ▶ $\mathcal{M}, v \models \varphi$ for all states v that are G -reachable from w in k steps.
- ▶ $\mathcal{M}, w \models C_G \varphi$ iff $\mathcal{M}, v \models \varphi$ for all states v that are G -reachable from w .

137

A group G has **distributed knowledge** of φ if the combined knowledge of the members of G implies φ .

- ▶ The question is how can we capture the idea of combining knowledge in our framework.
- ▶ The answer is: we combine the knowledge of the agents in group G by eliminating all worlds that some agent in G considers impossible.

Let \mathcal{M} be a model and $w \in \mathcal{M}$. We extend the definition of the satisfaction relation with the following clause:

$$\begin{aligned} \mathcal{M}, w \models D_G \varphi \quad &\text{iff} \quad \mathcal{M}, v \models \varphi \text{ for all } v \text{ such that } (w, v) \in \bigcap_{i \in G} \mathcal{K}_i \\ &\text{iff} \quad \mathcal{M}, v \models \varphi \text{ for all } v \text{ such that } \mathcal{K}_i wv \text{ for all } i \in G. \end{aligned}$$

138

Example - the card game

Let $\mathcal{M}_c = (\mathcal{F}_c, V)$ be the model describing the simple card game.

- ▶ $PROP = \{iX \mid i \in \{1, 2\}, X \in \{A, B, C\}\}$.
- ▶ iX read as **agent i holds card X**
- ▶ $V(iX) = \begin{cases} \{(X, Z) \mid Z \in \{A, B, C\} \setminus \{X\}\} & \text{if } i = 1 \\ \{(Z, X) \mid Z \in \{A, B, C\} \setminus \{X\}\} & \text{if } i = 2. \end{cases}$

\mathcal{F}_c is given by

139

Example - the card game

Let $G = \{1, 2\}$.

- ▶ $\mathcal{M}_c \models C_G(1A \vee 1B \vee 1C)$: it is common knowledge that agent 1 holds one of the cards A , B , and C .
- ▶ $\mathcal{M}_c \models C_G(1B \rightarrow (2A \vee 2C))$: it is common knowledge that if agent 1 holds card B , then agent 2 holds either card A or card C .
- ▶ $\mathcal{M}_c, (A, B) \models D_G(1A \wedge 2B)$: if the agents could combine their knowledge, they would know that in world (A, B) , agent 1 holds card A and agent 2 holds card B .

140

Muddy children puzzle

- ▶ A group of n children enters their house after having played in the mud outside. They are greeted in the hallway by their father, who notices that k of the children have mud on their foreheads.
- ▶ He makes the following announcement, “At least one of you has mud on his forehead.”
- ▶ The children can all see each other’s foreheads, but not their own.
- ▶ The father then says, “Do any of you know that you have mud on your forehead? If you do, raise your hand now.”
- ▶ No one raises his hand.
- ▶ The father repeats the question, and again no one moves.
- ▶ The father does not give up and keeps repeating the question.
- ▶ After exactly k repetitions, all the children with muddy foreheads raise their hands simultaneously.

141

Muddy children puzzle

For simplicity, let us call a child

- ▶ **muddy** if he has a muddy forehead;
- ▶ **clean** if he does not have a muddy forehead.

$k = 1$

- ▶ There exists only one muddy child.
- ▶ The muddy child knows the other children are clean.
- ▶ When the father says at least one is muddy, he concludes that it’s him.
- ▶ None of the other children know at this point whether or not they are muddy.
- ▶ The muddy child raises his hand after the father’s first question.
- ▶ After the muddy child raises his hand, the other children know that they are clean.

142

Muddy children puzzle

$k = 2$

- ▶ There exist two muddy children.
- ▶ Imagine that you are one of the two muddy children.
- ▶ You see that one of the other children is muddy.
- ▶ After the father’s first announcement, you do not have enough information to know whether you are muddy. You might be, but it could also be that the other child is the only muddy one.
- ▶ So, you do not raise the hand after the father’s first question.
- ▶ You note that the other muddy child does not raise his hand.
- ▶ You realize then that you yourself must be muddy as well, or else that child would have raised his hand.
- ▶ So, after the father’s second question, you raise your hand. Of course, so does the other muddy child.

143

Muddy children puzzle

We shall analyse the muddy children puzzle using epistemic logic.

We assume that it is common knowledge that

- ▶ the father is truthful,
- ▶ all the children can and do hear the father,
- ▶ all the children can and do see which of the other children besides themselves have muddy foreheads,
- ▶ none of the children can see his own forehead,
- ▶ all the children are truthful and (extremely) intelligent.

144

Muddy children puzzle

Suppose that there are n children; we number them $1, \dots, n$. Thus, we take $Ag = \{1, \dots, n\}$.

- ▶ First consider the situation before the father speaks.
- ▶ Some of the children are muddy, while the rest are clean.
- ▶ We describe a possible situation by an n -tuple of 0's and 1's of the form (x_1, \dots, x_n) , where $x_i = 1$ if child i is muddy, and $x_i = 0$ otherwise.
- ▶ There are 2^n possible situations.

145

Muddy children puzzle

$n = 3$

- ▶ Suppose that the actual situation is described by the tuple $(1, 0, 1)$, that says that child 1 and child 3 are muddy, while child 2 is clean.
- ▶ What situations does child 1 consider possible before the father speaks?
- ▶ Since child 1 can see the foreheads of all the children besides himself, his only doubt is about whether he is muddy or clean. Thus child 1 considers two situations possible: $(1, 0, 1)$ (the actual situation) and $(0, 0, 1)$. Similarly, child 2 considers two situations possible: $(1, 0, 1)$ and $(1, 1, 1)$.

In general, child i has the same information in two possible situations exactly if they agree in all components except possibly the i th component.

146

Muddy children puzzle

We can capture the general situation by the frame

$$\mathcal{F} = (W, \mathcal{K}_1, \dots, \mathcal{K}_n),$$

where

- ▶ $W = \{(x_1, \dots, x_n) \mid x_i \in \{0, 1\} \text{ for all } i = 1, \dots, n\}$. Thus, W has 2^n states.
- ▶ For every $i = 1, \dots, n$,
 $\mathcal{K}_i wv$ iff w and v agree in all components except possibly the i th component.
- ▶ One can easily see that \mathcal{K}_i 's are equivalence relations.

Thus, \mathcal{F} is a frame for the epistemic logic **S5**.

147

Muddy children puzzle

It remains to define $PROP$ and the valuation $V : PROP \rightarrow 2^W$.

- ▶ Since we want to reason about whether or not a given child is muddy, we take $PROP = \{p_1, \dots, p_n, p\}$, where, intuitively, p_i stands for **child i is muddy**, while p stands for **at least one child is muddy**.
- ▶ We define V as follows:
 $V(p_i) = \{(x_1, \dots, x_n) \in W \mid x_i = 1\}$,
 $V(p) = \{(x_1, \dots, x_n) \in W \mid x_j = 1 \text{ for some } j = 1, \dots, n\}$.
- ▶ It follows that
 $\mathcal{M}, (x_1, \dots, x_n) \models p_i$ iff $x_i = 1$,
 $\mathcal{M}, (x_1, \dots, x_n) \models p$ iff $x_j = 1$ for some $j = 1, \dots, n$.

We have a model with 2^n nodes, each described by an n -tuple of 0's and 1's, such that two nodes are joined by an edge exactly if they differ in at most one component.

148

Muddy children puzzle

Recall that we omit self-loops and the arrows on edges.

Figure 2: Frame for the muddy children puzzle with $n = 3$

- ▶ $\mathcal{M}, (1, 0, 1) \models K_1 \neg p_2$: child 1 knows that child 2 is clean
- ▶ $\mathcal{M}, (1, 0, 1) \models K_1 p_3$: child 1 knows that child 3 is muddy
- ▶ $\mathcal{M}, (1, 0, 1) \models \neg K_1 p_1$: child 1 does not know that he is muddy

149

Muddy children puzzle

- ▶ $\mathcal{M} \models C(p_2 \rightarrow K_1 p_2)$: it is common knowledge that if child 2 is muddy, then child 1 knows it.
- ▶ $\mathcal{M} \models C(\neg p_2 \rightarrow K_1 \neg p_2)$: it is common knowledge that if child 2 is clean, then child 1 knows it.

150

Muddy children puzzle

- ▶ $\mathcal{M}, (1, 0, 1) \models E p$: in $(1, 0, 1)$, every child knows that at least one child is muddy even before the father speaks;
- ▶ $\mathcal{M}, (1, 0, 1) \models \neg E^2 p$: p is not true at the state $(0, 0, 0)$ that is reachable in two steps from $(1, 0, 1)$.

151

Muddy children puzzle

One can check that in the general case, if we have n children of whom k are muddy (so that the situation is described by an n -tuple exactly k of whose components are 1's), then $E^{k-1}p$ is true, but $E^k p$ is not, since each state reachable in $k - 1$ steps has at least one 1 (and so there is at least one muddy child), but the tuple $(0, \dots, 0)$ is reachable in k steps.

152

Muddy children puzzle

Let us consider what happens after the father speaks.

- ▶ The father says p , which is already known to all the children if there are two or more muddy children.
- ▶ Nevertheless, the state of knowledge changes, even if all the children already know p .

153

Muddy children puzzle

- ▶ In $(1,0,1)$, child 1 considers the situation $(0,0,1)$ possible and in $(0,0,1)$ child 3 considers $(0,0,0)$ possible.
- ▶ In $(1,0,1)$, before the father speaks, although everyone knows that at least one is muddy, child 1 thinks it possible that child 3 thinks it possible that none of the children is muddy.
- ▶ After the father speaks, it becomes common knowledge that at least one child is muddy.

154

Muddy children puzzle

- ▶ In the general case, we can represent the change in the group's state of knowledge graphically by simply removing the point $(0,0,\dots,0)$ from the cube.
- ▶ More accurately, what happens is that the node $(0,0,\dots,0)$ remains, but all the edges between $(0,0,\dots,0)$ and nodes with exactly one 1 disappear, since it is common knowledge that even if only one child is muddy, after the father speaks that child will not consider it possible that no one is muddy.

155

Muddy children puzzle

Figure 3: Frame for $n = 3$ after the father speaks

156

Muddy children puzzle

Let us show that each time the children respond to the father's question with a **No**, the group's state of knowledge changes and the cube is further truncated.

- ▶ Consider what happens after the children respond **No** to the father's first question.
- ▶ Now all the nodes with exactly one 1 can be eliminated. (More accurately, the edges to these nodes from nodes with exactly two 1's all disappear from the graph.)
- ▶ Nodes with one or fewer 1's are no longer reachable from nodes with two or more 1's.

157

Muddy children puzzle

- ▶ If the actual situation were described by, say, the tuple $(1, 0, \dots, 0)$, then child 1 would initially consider two situations possible: $(1, 0, \dots, 0)$, and $(0, 0, \dots, 0)$.
- ▶ Since once the father speaks it is common knowledge that $(0, 0, \dots, 0)$ is not possible, he would then know that the situation is described by $(1, 0, \dots, 0)$, and thus would know that he is muddy.
- ▶ Once everyone answers **No** to the father's first question, it is common knowledge that the situation cannot be $(1, 0, \dots, 0)$.
- ▶ Similar reasoning allows us to eliminate every situation with exactly one 1. Thus, after all the children have answered **No** to the father's first question, it is common knowledge that **at least two children are muddy**.

158

Muddy children puzzle

- ▶ Further arguments in the same spirit can be used to show that after the children answer **No** k times, we can eliminate all the nodes with at most k 1's (or, more accurately, disconnect these nodes from the rest of the graph).
- ▶ We thus have a sequence of frames, describing the children's knowledge at every step in the process.
- ▶ Essentially, what is going on is that if, in some node w , it becomes common knowledge that a node v is impossible, then for every node u reachable from w , the edge from u to v (if there is one) is eliminated.

159

Muddy children puzzle

- ▶ After k rounds of questioning, it is common knowledge that at least $k + 1$ children are muddy.
- ▶ If the true situation is described by a tuple with exactly $k + 1$ 1's, then before the father asks the question for the $(k + 1)$ st time, the muddy children will know the exact situation, and in particular will know they are muddy, and consequently will answer **Yes**.
- ▶ Note that they could not answer **Yes** any earlier, since up to this point each muddy child considers it possible that he or she is clean.

160

- ▶ According to the way we are modeling **knowledge** in this context, a child **knows** a fact if the fact follows from his or her current information.
- ▶ However, if one of the children were not particularly bright, then he might not be able to figure out that he **knew** that he is muddy, even though in principle he had enough information to do so.
- ▶ To answer **Yes** to the father's question, the child must actually be aware of the consequences of his information.
- ▶ Our definition implicitly assumes that (it is common knowledge that) all reasoners are **logically omniscient**, that is they are smart enough to compute all the consequences of the information that they have.
- ▶ Furthermore, this **logical omniscience** is **common knowledge**.

161

Partition models of knowledge

162

Partition models of knowledge are defined in
Yoav Shoham, Kevin Leyton-Brown, **Multiagents Systems**,
Cambridge University Press, 2009

Let $n \geq 1$ and $\mathbf{Ag} = \{1, \dots, n\}$ be the set of agents.

Definition 3.5 (Partition frame)

A **partition frame** is a tuple $\mathcal{P}_F = (W, I_1, \dots, I_n)$, where

- ▶ W is a nonempty set of **possible worlds**.
- ▶ For every $i = 1, \dots, n$, I_i is a **partition** of W .

The idea is that I_i partitions W into sets of possible worlds that are **indistinguishable** from the point of view of agent i .

163

Recall: Let A be a nonempty set. A **partition** of A is a family $(A_j)_{j \in J}$ of nonempty subsets of A satisfying the following properties:

$$A = \bigcup_{j \in J} A_j \text{ and } A_j \cap A_k = \emptyset \text{ for all } j \neq k.$$

Recall: Let A be a nonempty set. There exists a bijection between the set of partitions of A and the set of equivalence relations on A :

- ▶ $(A_j)_{j \in J}$ partition of $A \mapsto$ the equivalence relation on A defined as follows:
$$x \sim y \Leftrightarrow \text{there exists } j \in J \text{ such that } x, y \in A_j.$$
- ▶ \sim equivalence relation on $A \mapsto$ the partition consisting of all the different equivalence classes of \sim .

164

Partition model of knowledge

- ▶ For each $i = 1, \dots, n$, let R_{I_i} be the corresponding equivalence relation.
- ▶ Denote by $I_i(w)$ the equivalence class of w in the relation R_{I_i} .
- ▶ If the actual world is w , then $I_i(w)$ is the set of possible worlds that agent i cannot distinguish from w .
- ▶ $\mathcal{F} = (W, R_{I_1}, \dots, R_{I_n})$ is a frame for the epistemic logic **S5**.

Partition frame = frame for the epistemic logic **S5**

165

Partition model of knowledge

Definition 3.6 (Partition model)

A **partition model** over a language Σ is a tuple $\mathcal{P}_M = (\mathcal{P}_F, \pi)$, where

- ▶ $\mathcal{P}_F = (W, I_1, \dots, I_n)$ is a partition frame.
- ▶ $\pi : \Sigma \rightarrow 2^W$ is an interpretation function.

For every statement $\varphi \in \Sigma$, we think of $\pi(\varphi)$ as the set of possible worlds in the partition model \mathcal{P}_M where φ is satisfied.

- ▶ Each possible world completely specifies the concrete state of affairs.
- ▶ We can take, for example, Σ to be a set of formulas in propositional logic over some set of atomic propositions.

166

Partition model of knowledge

We will use the notation $K_i\varphi$ as “agent i knows that φ ”.

The following defines when a statement is true in a partition model.

Definition 3.7 (Logical entailment for partition models)

Let $\mathcal{P}_M = (W, I_1, \dots, I_n, \pi)$ be a partition model over Σ , and $w \in W$. We define the \models (logical entailment) relation as follows:

- ▶ For any $\varphi \in \Sigma$, we say that $\mathcal{P}_M, w \models \varphi$ iff $w \in \pi(\varphi)$.
- ▶ $\mathcal{P}_M, w \models K_i\varphi$ iff for all worlds $v \in W$, if $v \in I_i(w)$, then $\mathcal{P}_M, v \models \varphi$.

Partition model = model for the epistemic logic **S5**

We can reason about knowledge rigorously in terms of partition models, hence using epistemic logic.

167

Partition model of knowledge

We apply the partition model of knowledge to the Muddy Children puzzle.

- ▶ We consider the case $n = k = 2$ (two children, both muddy).
- ▶ There are two atomic propositions: **muddy1** and **muddy2**.
- ▶ There are four possible worlds, corresponding to each of the children being muddy or not:
 - w_1 : **muddy1** \wedge **muddy2** (real world)
 - w_2 : **muddy1** \wedge \neg **muddy2**
 - w_3 : \neg **muddy1** \wedge **muddy2**
 - w_4 : \neg **muddy1** \wedge \neg **muddy2**.
- ▶ Thus, $\pi(\text{muddy1}) = \{w_1, w_2\}$ and $\pi(\text{muddy2}) = \{w_1, w_3\}$.
- ▶ There are two partitions I_1 and I_2 .

168

Partition model of knowledge

Figure 4: Partition model after the children see each other

- ▶ The ovals illustrate the four possible worlds, with the dark oval indicating the true state of the world.
- ▶ The solid boxes indicate the equivalence classes in I_1 :
 $I_1(w_1) = I_1(w_3) = \{w_1, w_3\}$, $I_1(w_2) = I_1(w_4) = \{w_2, w_4\}$
- ▶ The dashed boxes indicate the equivalence classes in I_2 :
 $I_2(w_1) = I_2(w_2) = \{w_1, w_2\}$, $I_2(w_3) = I_2(w_4) = \{w_3, w_4\}$.
- ▶ In the real world w_1 , $K_1muddy2$ and $K_2muddy1$ are true; neither $K_1muddy1$ nor $K_2muddy2$ is true.

169

Partition model of knowledge

Figure 5: Partition model after the father's announcement

- ▶ The world in which neither child is muddy is ruled out. The state of knowledge is as shown in Figure 5.
 $I_1(w_1) = I_1(w_3) = \{w_1, w_3\}$, $I_1(w_2) = \{w_2\}$, $I_1(w_4) = \{w_4\}$
 $I_2(w_1) = I_2(w_2) = \{w_1, w_2\}$, $I_2(w_3) = \{w_3\}$, $I_2(w_4) = \{w_4\}$.
- ▶ In the real world w_1 , it is still the case that neither $K_1muddy1$ nor $K_2muddy2$ is true.

170

Partition model of knowledge

Figure 6: Final partition model

- ▶ Once the children each observe that the other child does not raise his hand after the father's question, the state of knowledge becomes as shown in Figure 6:
- ▶ $I_k(w_i) = \{w_i\}$ for all $k = 1, 2$, $i = 1, \dots, 4$.
- ▶ Both $K_1muddy1$ and $K_2muddy2$ hold now in the real world w_1 .

171

Multiagent systems

Textbook:

R. Fagin, J.Y. Halpern, Y. Moses, M. Vardi, [Reasoning About Knowledge](#), MIT Press, 2004

172

Runs and systems

173

Multiagent systems

- ▶ A **multiagent system** is any collection of interacting agents.
- ▶ One of the major application areas of **reasoning about knowledge**: multiagent systems.

Examples

- ▶ The children and the father in the muddy children puzzle are **agents** in a multiagent system.
- ▶ A game such as poker is a multiagent system. We refer to agents as **players**.
- ▶ A distributed system consisting of processes in a computer network running a particular protocol is a multiagent system. We refer to agents as **processes** or **sites**.

174

Multiagent systems

We define in the sequel a **formal model** of **multiagent systems** that is **general enough** to allow us to capture all the **important features** of multiagent systems.

Key assumptions

- ▶ We look at the system at **any point in time**, each of the agents is in a **unique state**. We refer to this as the agent's **local state**.
- ▶ An agent's local state encapsulates **all the information** to which the **agent has access**.
- ▶ We do not make any additional assumptions about the local state.

175

Multiagent systems

Assume that $n \geq 1$ and $Ag = \{1, \dots, n\}$ is the set of agents.

- ▶ As each agent has a state, we think of the whole system as being in some state.
- ▶ First idea: take the system's state to be a tuple of the form (s_1, \dots, s_n) , where s_i is the local state of agent i .
- ▶ However, in general, **more than** just the local states of the agents may be relevant when analyzing a system.

Examples

- ▶ Consider a message-passing system where processes send messages back and forth along communication lines. We would like to know about messages that are in transit or about whether a communication line is up or down.
- ▶ Consider a system of sensors observing some terrain. We need to include features of the terrain in a description of the state of the system.

176

We conceptually divide a system into two components:

- ▶ the **agents** and
- ▶ the **environment**,

where we view the environment as **everything else that is relevant**. The environment can be viewed as just another agent, though it typically plays a special role in our analyses.

We define a **global state** of a system to be an $(n + 1)$ -tuple of the form (s_e, s_1, \dots, s_n) , where s_e is the state of the **environment** and s_i is the local state of **agent i** .

177

- ▶ A global state describes the system at a given point in time. But a system is not a static entity; it constantly changes.
- ▶ Since we are mainly interested in how systems change over time, we need to build time into our model.
- ▶ We define a **run** to be a **function from time to global states**.
- ▶ Intuitively, a run is a complete description of how the system's global state evolves over time.
- ▶ We take **time** to range over the **natural numbers**. Thus, time steps are discrete and time is infinite.
- ▶ The initial global state of the system in a possible execution r is $r(0)$, the next global state is $r(1)$, and so on.
- ▶ The assumption that time is discrete is a natural one, as computers proceed in discrete time steps. Allowing time to be infinite makes it easier to model situations where **there is no a priori time bound** on how long the system will run.

178

- ▶ We assume that time is measured on **some clock external** to the system.
- ▶ We **do not assume** that agents in the system necessarily **have access** to this clock; at time m measured on the external clock, agent i need not know it is time m .
- ▶ If an agent does know the time, then this information would be encoded in his local state.
- ▶ This external clock need not measure **real time**.
- ▶ We model the external clock in whatever way makes it easiest for us to analyze the system.
- ▶ In the case of the muddy children puzzle, there could be **one tick of the clock** for every round of questions by the father and every round of answers to the father's question.
- ▶ In a poker game, there could be **one tick of the clock** each time someone bets or discards.

179

A system can have **many possible runs**, since the system's global state can evolve in many possible ways: there are a number of possible initial states and many things that could happen from each initial global state.

- ▶ The **basic idea** is to define a **system** to be a **nonempty set of runs**.
- ▶ Instead of trying to **model the system directly**, the definition **models the possible behaviors of the system**.
- ▶ The set of runs is **nonempty**, as the system we are modeling should have some behaviors.

We use the term **system** in two ways: as the **real-life collection of interacting agents** or as **a set of runs**.

180

- ▶ Let L_e be a set of possible states for the **environment** and let L_i be a set of possible local states for **agent i** for $i = 1, \dots, n$.
- ▶ We take $\mathcal{G} = L_e \times L_1 \times \dots \times L_n$ to be the set of **global states**.

Definition 4.1

A **run over \mathcal{G}** is a function $r : \mathbb{N} \rightarrow \mathcal{G}$.

A run r over \mathcal{G} can be identified with the sequence $(r(m))_{m \in \mathbb{N}}$ of global states in \mathcal{G} .

Definition 4.2

We refer to a pair (r, m) consisting of a run r and time m as a **point**. We say that $r(m)$ is the global state at the point (r, m) .

181

A **round** takes place between two time points. We define round m in run r to take place between time $m - 1$ and time m . We view an agent as performing an **action** during a round.

Let (r, m) be a point and $r(m) = (s_e, s_1, \dots, s_n)$ be the global state at (r, m) . We define

$$r_e(m) = s_e \text{ and } r_i(m) = s_i \text{ for all } i = 1, \dots, n.$$

Thus, $r_i(m)$ is agent i 's local state at the point (r, m) .

Definition 4.3

A **system \mathcal{R} over \mathcal{G}** is a nonempty set of runs over \mathcal{G} . We say that (r, m) is a **point in system \mathcal{R}** if $r \in \mathcal{R}$. We denote by $\mathcal{P}_{\mathcal{R}}$ the set of points of \mathcal{R} .

In practice, the appropriate set of runs will be chosen by the system designer or the person analyzing the system.

182

- ▶ Imagine we have two processes, say a **sender S** and a **receiver R** , that communicate over a communication line.
- ▶ The sender starts with **one bit** (either 0 or 1) that it wants to communicate to the receiver.
- ▶ The communication line is faulty. There is no guarantee that a message sent by either S or R will be received.
- ▶ We assume that a message is either received in the same round that it is sent, or lost altogether. Thus, rounds are long enough for a message to be sent and delivered.
- ▶ This type of message loss is the only possible faulty behavior in the system.

183

- ▶ Because of the uncertainty regarding possible message loss, S sends the bit to R in every round, until S receives a message from R acknowledging receipt of the bit. We call this message from R an **ack** message.
- ▶ R starts **sending** the **ack** message in the **round after it receives the bit**. To allow S to stop sending the bit, R continues to send the ack repeatedly from then on.

This informal description gives what we call a **protocol for S and R** : it is a specification of what they do at each step.

184

Bit-transmission problem

- ▶ S sends the bit to R until S receives the ack message; before it receives the ack message, S **does not know** whether R received the bit.
- ▶ R **knows** perfectly well that S stops sending messages after it receives an ack message, but R **never knows** for certain that S actually received its acknowledgment.
- ▶ Even if R does not receive messages from S for a while, R **does not know** whether this is because S received an ack message from R ; it could be because the messages that S sent were lost in the communication channel.

185

Bit-transmission problem

- ▶ We could have S send an **ack-ack** message (an acknowledgment to the acknowledgment) so that R could stop sending the acknowledgment once it receives an ack-ack message from S .
- ▶ But this only pushes the problem up one level: S will not be able to safely stop sending ack-ack messages, since S has no way of **knowing** that R has received an ack-ack message.
- ▶ This type of **uncertainty is inherent** in systems where communication is not guaranteed.

186

Bit-transmission problem

We formalize the bit-transmission problem as a **system**.

To describe the **set of runs** that make up this system,

- ▶ we choose to have the local states of S and R include very little information; essentially, just enough to allow us to carry out our analysis.
- ▶ it is useful to have the environment's state record the events taking place in the system.
